addAMDISPeaks

Add AMDIS peak detection results

Description

Reads ASCII ELU-format files (output from AMDIS) and attaches them to an already created peaksDataset object

Usage

```
addAMDISPeaks(object,fns=dir(,"[Eu][L1][Uu]"),verbose=TRUE,...)
```

Arguments

object a peaksDataset object.

fns character vector of same length as object@rawdata (user ensures the order

matches)

whether to give verbose output, default TRUE verbose

arguments passed on to parseELU

Details

Repeated calls to parseELU to add peak detection results to the original peaksDataset object.

Value

peaksDataset object

Author(s)

Mark Robinson

References

Mark D Robinson (2008). Methods for the analysis of gas chromatography - mass spectrometry data PhD dissertation University of Melbourne.

See Also

parseELU, peaksDataset

addChromaTOFPeaks 3

Examples

```
# need access to CDF (raw data) and ELU files
require(gcspikelite)
gcmsPath<-paste(.find.package("gcspikelite"),"data",sep="/")

# full paths to file names
cdfFiles<-dir(gcmsPath,"CDF",full=TRUE)
eluFiles<-dir(gcmsPath,"ELU",full=TRUE)

# create a 'peaksDataset' object and add AMDIS peaks to it
pd<-peaksDataset(cdfFiles[1],mz=seq(50,550),rtrange=c(7.5,8.5))
pd<-addAMDISPeaks(pd,eluFiles[1])</pre>
```

addChromaTOFPeaks

Add ChromaTOF peak detection results

Description

Reads ASCII tab-delimited format files (output from ChromaTOF) and attaches them to an already created peaksDataset object

Usage

```
add Chroma TOF Peaks (object, fns=dir(, "[Tt][Xx][Tx]"), rtDivide=60, verbose=TRUE, \ldots) \\
```

Arguments

object a peaksDataset object.

fns character vector of same length as object@rawdata (user ensures the order

matches)

rtDivide number giving the amount to divide the retention times by.

verbose whether to give verbose output, default TRUE arguments passed on to parseChromaTOF

Details

Repeated calls to parseChromaTOF to add peak detection results to the original peaksDataset object.

Value

peaksDataset object

Author(s)

Mark Robinson

References

Mark D Robinson (2008). Methods for the analysis of gas chromatography - mass spectrometry data *PhD dissertation* University of Melbourne.

# [not run] cTofFiles<-dir(gcmsPath,"txt",full=TRUE)

# create a 'peaksDataset' object and add ChromaTOF peaks to it
pd<-peaksDataset(cdfFiles[1],mz=seq(50,550),rtrange=c(7.5,8.5))
# [not run] pd<-addChromTOFPeaks(pd,...)</pre>
```

betweenAlignment

Data Structure for "between" alignment of many GCMS samples

Description

This function creates a "between" alignment (i.e. comparing merged peaks)

Usage

 $between \verb|Alignment(pD,cAList,pAList,impList,filterMin=3,gap=0.7,D=10,usePeaks=TRUE,df=30,verbose=10,packs=10$

Arguments

рυ	a peaksDataset object
cAList	list of clusterAlignment objects, one for each experimental group
pAList	list of progressiveAlignment objects, one for each experimental group
impList	list of imputation lists
filterMin	minimum number of peaks within a merged peak to be kept in the analysis
gap	gap parameter
D	retention time penalty parameter
usePeaks	logical, whether to use peaks (if TRUE) or the full 2D profile alignment (if FALSE)
df	distance from diagonal to calculate similarity
verbose	logical, whether to print information

Details

betweenAlignment objects gives the data structure which stores the result of an alignment across several "pseudo" datasets. These pseudo datasets are constructed by merging the "within" alignments.

Value

betweenAlignment object

calcTimeDiffs 5

Author(s)

Mark Robinson

References

Mark D Robinson (2008). Methods for the analysis of gas chromatography - mass spectrometry data *PhD dissertation* University of Melbourne.

See Also

```
multipleAlignment
```

Examples

```
require(gcspikelite)
# see 'multipleAlignment'
```

calcTimeDiffs

Calculate retention time shifts from profile alignments

Description

This function takes the set of all pairwise profile alignments and use these to estimate retention time shifts between each pair of samples. These will then be used to normalize the retention time penalty of the signal peak alignment.

Usage

```
calcTimeDiffs(pd,ca.full,verbose=TRUE)
```

Arguments

pd a peaksDataset object

ca.full a clusterAlignment object, fit with verbose logical, whether to print out information

Details

Using the set of profile alignments,

Value

list of same length as ca.full@alignments with the matrices giving the retention time penalties.

Author(s)

Mark Robinson

References

Mark D Robinson (2008). Methods for the analysis of gas chromatography - mass spectrometry data *PhD dissertation* University of Melbourne.

6 clusterAlignment

See Also

```
peaksAlignment, clusterAlignment
```

Examples

```
require(gcspikelite)
# paths and files
gcmsPath<-paste(.find.package("gcspikelite"), "data", sep="/")</pre>
cdfFiles<-dir(gcmsPath,"CDF",full=TRUE)</pre>
eluFiles<-dir(gcmsPath,"ELU",full=TRUE)</pre>
# read data, peak detection results
pd < -peaks Dataset(cdfFiles[1:2], mz = seq(50,550), rtrange = c(7.5,8.5))\\
pd<-addAMDISPeaks(pd,eluFiles[1:2])</pre>
# pairwise alignment using all scans
fullca<-clusterAlignment(pd, usePeaks = FALSE, df = 100)</pre>
# calculate retention time shifts
timedf<-calcTimeDiffs(pd, fullca)</pre>
```

clusterAlignment

Data Structure for a collection of all pairwise alignments of GCMS

Description

Store the raw data and optionally, information regarding signal peaks for a number of GCMS runs

Usage

```
clusterAlignment(pD,runs=1:length(pD@rawdata),timedf=NULL,usePeaks=TRUE,verbose=TRUE,...)
```

Arguments

рD a peaksDataset object.

vector of integers giving the samples to calculate set of pairwise alignments over. runs timedf

list (length = the number of pairwise alignments) of matrices giving the expected

time differences expected at each pair of peaks (used with usePeaks=TRUE,

passed to peaksAlignment

usePeaks logical, TRUE uses peakdata list, FALSE uses rawdata list for computing simi-

larity.

logical, whether to print out info. verbose

other arguments passed to peaksAlignment

Details

clusterAlignment computes the set of pairwise alignments.

7 compress

Value

```
clusterAlignment object
```

Author(s)

Mark Robinson

References

Mark D Robinson (2008). Methods for the analysis of gas chromatography - mass spectrometry data PhD dissertation University of Melbourne.

See Also

```
peaksDataset, peaksAlignment
```

Examples

```
require(gcspikelite)
# paths and files
gcmsPath<-paste(.find.package("gcspikelite"), "data", sep="/")</pre>
cdfFiles<-dir(gcmsPath,"CDF",full=TRUE)</pre>
eluFiles<-dir(gcmsPath,"ELU",full=TRUE)</pre>
# read data, peak detection results
pd<-peaksDataset(cdfFiles[1:2],mz=seq(50,550),rtrange=c(7.5,8.5))</pre>
pd<-addAMDISPeaks(pd,eluFiles[1:2])</pre>
ca<-clusterAlignment(pd, gap = .5,D=.05,df=30)</pre>
```

compress

Compress an alignment object

Description

Many of the peaks are not similar. So, the set of pairwise similarity matrices can be compressed.

Usage

```
compress(object,verbose=TRUE,...)
decompress(object,verbose=TRUE,...)
```

Arguments

. . .

object a peaksAlignment, peaksAlignment or peaksAlignment object to be comverbose logical, whether to print out information further arguments

8 dp

Details

Using sparse matrix representations, a significant compression can be achieved. Here, we use the matrix.csc class of the SpareM package.

Value

an object of the same type as the input object

Author(s)

Mark Robinson

References

Mark D Robinson (2008). Methods for the analysis of gas chromatography - mass spectrometry data *PhD dissertation* University of Melbourne.

See Also

# read data, peak detection results
pd<-peaksDataset(cdfFiles[1:2],mz=seq(50,550),rtrange=c(7.5,8.5))
pd<-addAMDISPeaks(pd,eluFiles[1:2])

# pairwise alignment (it is compressed by default)
ca<-clusterAlignment(pd, usePeaks = TRUE, df = 20)
object.size(ca)

# decompress
ca<-decompress(ca)
object.size(ca)</pre>
```

dp

Dynamic programming algorithm, given a similarity matrix

Description

This function calls C code for a bare-bones dynamic programming algorithm, finding the best cost path through a similarity matrix.

Usage

```
dp(M,gap=.5,big=1000000000,verbose=FALSE)
```

dp 9

Arguments

М	similarity matrix
gap	penalty for gaps
big	large value used for matrix margins
verbose	logical, whether to print out information

Details

This is a pretty standard implementation of a bare-bones dynamic programming algorithm, with a single gap parameter and allowing only simple jumps through the matrix (up, right or diagonal).

Value

list with element match with the set of pairwise matches.

Author(s)

Mark Robinson

References

Mark D Robinson (2008). Methods for the analysis of gas chromatography - mass spectrometry data *PhD dissertation* University of Melbourne.

peaksAlignment

gatherInfo	Gathers abundance informations from an alignment

Description

Given an alignment table (indices of matched peaks across several samples) such as that within a progressiveAlignment or multipleAlignment object, this routines goes through the raw data and collects the abundance of each fragment peak, as well as the retention times across the samples.

Usage

```
gatherInfo(pD, obj, newind = NULL, method = c("apex"), findmzind = TRUE, useTIC = FALSE, top = NULL, method = c("apex"), findmzind = TRUE, useTIC = FALSE, top = NULL, method = c("apex"), findmzind = TRUE, useTIC = FALSE, top = NULL, method = c("apex"), findmzind = TRUE, useTIC = FALSE, top = NULL, method = c("apex"), findmzind = TRUE, useTIC = FALSE, top = NULL, method = c("apex"), findmzind = TRUE, useTIC = FALSE, top = NULL, method = c("apex"), findmzind = TRUE, useTIC = FALSE, top = NULL, method = c("apex"), findmzind = TRUE, useTIC = FALSE, top = NULL, method = c("apex"), findmzind = TRUE, useTIC = FALSE, top = NULL, method = c("apex"), findmzind = TRUE, useTIC = FALSE, top = NULL, method = c("apex"), findmzind = TRUE, useTIC = FALSE, top = NULL, method = c("apex"), findmzind = top = c("apex"), findmzind = c("apex"),
```

Arguments

pD	a peaksDataset object, to get the abundance data from
obj	either a multipleAlignment or progressiveAlignment object
newind	list giving the
method	method used to gather abundance information, only apex implemented currently.
findmzind	logical, whether to take a subset of all m/z indices
useTIC	logical, whether to use total ion current for abundance summaries
top	only use the top top peaks

Details

This procedure loops through the table of matched peaks and gathers the

intensity.cut percentage of the maximum intensity

imputePeaks 11

Value

Returns a list (of lists) for each row in the alignment table. Each list has 3 elements:

mz a numerical vector of the m/z fragments used

nm<-list(paste("MP",1:length(d),sep=""),c("S1","S2"))</pre>

rts<-matrix(unlist(sapply(d,.subset,"rt")),byrow=TRUE,nc=2,dimnames=nm)</pre>

rt a numerical vector for the exact retention time of each peak across all samples data matrix of fragment intensities. If useTIC=TRUE, this matrix will have a single

row

Author(s)

Mark Robinson

References

Mark D Robinson (2008). Methods for the analysis of gas chromatography - mass spectrometry data *PhD dissertation* University of Melbourne.

pd<-addAMDISPeaks(pd,eluFiles[1:2])

# multiple alignment
ma<-multipleAlignment(pd,c(1,1),wn.gap=0.5,wn.D=.05,bw.gap=0.6,bw.D=.2,usePeaks=TRUE,filterMin=1,df=50,vert
# gather apex intensities
d<-gatherInfo(pd,ma)

# table of retention times</pre>
```

imputePeaks

Imputatin of locations of peaks that were undetected

Description

Using the information within the peaks that are matched across several runs, we can impute the location of the peaks that are undetected in a subset of runs

12 imputePeaks

Usage

```
imputePeaks(pD, obj, type = 1, obj2 = NULL, filterMin = 3, verbose = TRUE)
```

Arguments

pD	a peaksDataset object
obj	the alignment object, either multipleAlignment or progressiveAlignment, that is used to infer the unmatched peak locations
type	type of imputation to do, 1 for simple linear interpolation (default), 2 only works if obj2 is a clusterAlignment object
obj2	a clusterAlignment object
filterMin	minimum number of peaks within a merged peak to impute
verbose	logical, whether to print out information

Details

If you are aligning several samples and for a (small) subset of the samples in question, a peak is undetected, there is information within the alignment that can be useful in determining where the undetected peak is, based on the surrounding matched peaks. Instead of moving forward with missing values into the data matrices, this procedures goes back to the raw data and imputes the location of the apex (as well as the start and end), so that we do not need to bother with post-hoc imputation or removing data because of missing components.

We realize that imputation is prone to error and prone to attributing intensity from neighbouring peaks to the unmatched peak. We argue that this is still better than having to deal with these in statistical models after that fact. This may be an area of future improvement.

Value

list with 3 elements apex, start and end, each masked matrices giving the scan numbers of the imputed peaks.

```

multipleAlignment-class

Data Structure for multiple alignment of many GCMS samples

Description

Store the raw data and optionally, information regarding signal peaks for a number of GCMS runs

Usage

multipleAlignment(pd,group,bw.gap=0.8,wn.gap=0.6,bw.D=.20,wn.D=.05,filterMin=3,lite=FALSE,usePea

Arguments

pd	a peaksDataset object
group	factor variable of experiment groups, used to guide the alignment algorithm
bw.gap	gap parameter for "between" alignments
wn.gap	gap parameter for "within" alignments
bw.D	distance penalty for "between" alignments
wn.D	distance penalty for "within" alignments
filterMin	minimum number of peaks within a merged peak to be kept in the analysis
lite	logical, whether to keep "between" alignment details (default, FALSE)
usePeaks	logical, whether to use peaks (if TRUE) or the full 2D profile alignment (if FALSE)
df	distance from diagonal to calculate similarity
verbose	logical, whether to print information
timeAdjust	logical, whether to use the full 2D profile data to estimate retention time drifts (Note: time required)
doImpute	logical, whether to impute the location of unmatched peaks

Details

multipleAlignment is the data structure giving the result of an alignment across several GCMS runs.

Multiple alignments are done progressively. First, all samples with the same tg\$Group label with be aligned (denoted a "within" alignment). Second, each group will be summarized into a pseudodata set, essentially a spectrum and retention time for each matched peak of the within-alignment. Third, these "merged peaks" are aligned in the same progressive manner, here called a "between" alignment.

```

normDotProduct

Normalized Dot Product

Description

This function calculates the similarity of all pairs of peaks from 2 samples, using the spectra similarity

Usage

```
normDotProduct(x1,x2,t1=NULL,t2=NULL,df=max(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALS(ncol(x1),ncol(x2)),D=1000000,timedf=NULL,verbose=TALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=TALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=TALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=TALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=TALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=TALS(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=TALS(ncol(x1),ncol(x2)),D=100000,timedf=NUL
```

Arguments

x1	data matrix for sample 1
x2	data matrix for sample 2
t1	vector of retention times for sample 1
t2	vector of retention times for sample 2
df	distance from diagonal to calculate similarity

parseChromaTOF 15

D retention time penalty

timedf matrix of time differences to normalize to. if NULL, 0 is used.

verbose logical, whether to print out information

Details

Efficiently computes the normalized dot product between every pair of peak vectors and returns a similarity matrix. C code is called.

Value

matrix of similarities

Author(s)

Mark Robinson

```

parseChromaTOF

Parser for ChromaTOF files

Description

Reads ASCII ChromaTOF-format files from AMDIS (Automated Mass Spectral Deconvolution and Identification System)

Usage

```
parse Chroma TOF (fn, min.pc=.01, mz=seq(85,500), rt.cut=.008, rtrange=NULL, skip=1, rtDivide=60)
```

16 parseChromaTOF

Arguments

fn	ChromaTOF filename to read.
min.pc	minimum percent of maximum intensity.
mz	vector of mass-to-charge bins of raw data table.
rt.cut	the difference in retention time, below which peaks are merged together.
rtrange	retention time range to parse peaks from, can speed up parsing if only interested in a small region (must be numeric vector of length 2)
skip	number of rows to skip at beginning of the ChromaTOF
rtDivide	multiplier to divide the retention times by (default: 60)

Details

parseChromaTOF will typically be called by addChromaTOFPeaks, not called directly.

Peaks that are detected within rt.cut are merged together. This avoids peaks which are essentially overlapping.

Fragments that are less than min.pc of the maximum intensity fragment are discarded.

Value

list with components peaks (table of spectra – rows are mass-to-charge and columns are the different detected peaks) and tab (table of features for each detection), according to what is stored in the ChromaTOF file.

Author(s)

Mark Robinson

```

parseELU 17

parseELU	Parser for ELU files	

Description

Reads ASCII ELU-format files from AMDIS (Automated Mass Spectral Deconvolution and Identification System)

Usage

```
parseELU(f,min.pc=.01,mz=seq(50,550),rt.cut=.008,rtrange=NULL)
```

Arguments

f	ELU filename to read.
min.pc	minimum percent of maximum intensity.
mz	vector of mass-to-charge bins of raw data table.
rt.cut	the difference in retention time, below which peaks are merged together.
rtrange	retention time range to parse peaks from, can speed up parsing if only interested in a small region (must be numeric vector of length 2)

Details

parseELU will typically be called by addAMDISPeaks, not called directly.

Peaks that are detected within rt.cut are merged together. This avoids peaks which are essentially overlapping.

Fragments that are less than min.pc of the maximum intensity fragment are discarded.

Value

list with components peaks (table of spectra – rows are mass-to-charge and columns are the different detected peaks) and tab (table of features for each detection), according to what is stored in the ELU file.

peaksAlignment-class Data Structure for pairwise alignment of 2 GCMS samples

Description

Store the raw data and optionally, information regarding signal peaks for a number of GCMS runs

Usage

peaks A lignment (d1, d2, t1, t2, gap=.5, D=1000, timedf=NULL, df=30, verbose=TRUE, use Peaks=TRUE, compress=7, D=1000, timedf=NULL, df=30, verbose=TRUE, use Peaks=TRUE, use Peaks=TRUE

Arguments

d1	matrix of MS intensities for 1st sample (if doing a peak alignment, this contains peak apexes/areas; if doing a profile alignment, this contains scan intensities. Rows are m/z bins, columns are peaks/scans.
d2	matrix of MS intensities for 2nd sample
t1	vector of retention times for 1st sample
t2	vector of retention times for 2nd sample
gap	gap penalty for dynamic programming algorithm
D	time penalty (on same scale as retention time differences, t1 and t2)
timedf	list (length = the number of pairwise alignments) of matrices giving the expected time differences expected at each pair of peaks (used with usePeaks=TRUE.
df	integer, how far from the diagonal to go to calculate the similarity of peaks. Smaller value should run faster, but be careful not to choose too low.
verbose	logical, whether to print out info.
usePeaks	logical, TRUE uses peakdata list, FALSE uses rawdata list for computing similarity.
compress	logical, whether to compress the similarity matrix into a sparse format.

Details

peaksAlignment is a hold-all data structure of the raw and peak detection data.

Value

```
peaksAlignment object
```

peaksDataset 19

```
# see clusterAlignment, it calls peaksAlignment
```

peaksDataset Data Structure for raw GCMS data and peak detection results

Description

Store the raw data and optionally, information regarding signal peaks for a number of GCMS runs

Usage

```
peaksDataset(fns=dir(,"[Cc][Dd][Ff]"),verbose=TRUE,mz=seq(50,550),rtDivide=60,rtrange=NULL)
```

Arguments

fns character vector, filenames of raw data in CDF format.

verbose logical, if TRUE then iteration progress information is output.

mz vector giving bins of raw data table.

rtDivide number giving the amount to divide the retention times by.

rtrange retention time range to limit data to (must be numeric vector of length 2)

Details

peaksDataset is a hold-all data structure of the raw and peak detection data.

Value

peaksDataset object

Examples

```
require(gcspikelite)

# paths and files
gcmsPath<-paste(.find.package("gcspikelite"),"data",sep="/")
cdfFiles<-dir(gcmsPath,"CDF",full=TRUE)
eluFiles<-dir(gcmsPath,"ELU",full=TRUE)

# read data
pd<-peaksDataset(cdfFiles[1:2],mz=seq(50,550),rtrange=c(7.5,8.5))
show(pd)</pre>
```

plot.peaksDataset

Plotting functions for GCMS data objects

Description

Store the raw data and optionally, information regarding signal peaks for a number of GCMS runs

Usage

Arguments

object a peaksDataset, peaksAlignment or clusterAlignment object.

runs for peaksDataset only: set of run indices to plot

mzind for peaksDataset only: set of mass-to-charge indices to sum over (default, all)

mind for peaksDataset only: matrix of aligned indices

plotSampleLabels

for peaksDataset only: logical, whether to display sample labels

calcGlobalMax for peaksDataset only: logical, whether to calculate an overall maximum for

scaling

peakCex character expansion factor for peak labels

plotPeaks for peaksDataset only: logical, whether to plot hashes for each peak

plot.peaksDataset 21

plotPeakBoundaries

for peaksDataset only: logical, whether to display peak boundaries

plotPeakLabels for peaksDataset only: logical, whether to display peak labels

plotMergedPeakLabels

for peaksDataset only: logical, whether to display 'merged' peak labels

mlwd for peaksDataset only: line width of lines indicating the alignment

usePeaks for peaksDataset only: logical, whether to plot alignment of peaks (otherwise,

scans)

plotAcrossRuns for peaksDataset only: logical, whether to plot across peaks when unmatched

peak is given

overlap for peaksDataset only: logical, whether to plot TIC/XICs overlapping
rtrange for peaksDataset only: vector of length 2 giving start and end of the X-axis
cols for peaksDataset only: vector of colours (same length as the length of runs)
thin for peaksDataset only: when usePeaks=FALSE, plot the alignment lines every

thin values

max.near for peaksDataset only: where to look for maximum

how.near for peaksDataset only: how far away from max.near to look scale.up for peaksDataset only: a constant factor to scale the TICs plotMatches for peaksDataset only: logical, whether to plot matches

xlab for peaksAlignment and clusterAlignment only: x-axis label ylab for peaksAlignment and clusterAlignment only: y-axis label

matchPch for peaksAlignment and clusterAlignment only: match plotting character

matchLwd for peaksAlignment and clusterAlignment only: match line width

matchCex for peaksAlignment and clusterAlignment only: match character expansion

factor

 $\verb|matchCol| for peaksAlignment| and \verb|clusterAlignment| only: match colour|$

for peaksAlignment and clusterAlignment only: vector of colours for colourscale breaks for peaksAlignment and clusterAlignment only: vector of breaks for colourscale alignment for peaksAlignment and clusterAlignment only: the set of alignments to plot

... further arguments passed to the plot or image command

Details

For peakDataset objects, each TIC is scale to the maximum value (as specified by the how.near and max.near values). The many parameters gives considerable flexibility of how the TICs can be visualized.

For peakAlignment objects, the similarity matrix is plotted and optionally, the set of matching peaks. clusterAlignment objects are just a collection of all pairwise peakAlignment objects.

eluFiles<-dir(gcmsPath,"ELU",full=TRUE)

# read data
pd<-peaksDataset(cdfFiles[1:3],mz=seq(50,550),rtrange=c(7.5,8.5))

# image plot
plot(pd,rtrange=c(7.5,8.5),plotPeaks=TRUE,plotPeakLabels=TRUE)</pre>
```

plotImage

Plot of images of GCMS data

Description

Image plots (i.e. 2D heatmaps) of raw GCMS profile data

Usage

```
plotImage(object,run=1,rtrange=c(11,13),main=NULL,mzrange=c(50,200),SCALE=log2,...)
```

Arguments

object a peaksDataset object

run index of the run to plot an image for

rtrange vector of length 2 giving start and end of the X-axis (retention time)

main main title (auto-constructed if not specified)

mzrange vector of length 2 giving start and end of the Y-axis (mass-to-charge ratio)

SCALE function called to scale the data (default: log2)
... further arguments passed to the image command

Details

For peakDataset objects, each TIC is scale to the maximum value (as specified by the how.near and max.near values). The many parameters gives considerable flexibility of how the TICs can be visualized.

For peakAlignment objects, the similarity matrix is plotted and optionally, the set of matching peaks. clusterAlignment objects are just a collection of all pairwise peakAlignment objects.

plotImage(pd,run=1,rtrange=c(7.5,8.5),main="")</pre>
```

progressiveAlignment-class

Data Structure for progressive alignment of many GCMS samples

Description

Performs a progressive peak alignment (clustalw style) of multiple GCMS peak lists

Usage

```
progressiveAlignment(pD,cA,D=1000,gap=.5,verbose=TRUE,usePeaks=TRUE,df=30,compress=TRUE)
```

Arguments

pD a peaksDataset object
cA a clusterAlignment object
D retention time penalty

gap gap parameter

verbose logical, whether to print information

usePeaks logical, whether to use peaks (if TRUE) or the full 2D profile alignment (if FALSE)

df distance from diagonal to calculate similarity

compress logical, whether to store the similarity matrices in sparse form

Details

The progressive peak alignment we implemented here for multiple GCMS peak lists is analogous to how clustalw takes a set of pairwise sequence alignments and progressively builds a multiple alignment. More details can be found in the reference below.

```

rmaFitUnit

Fits a robust linear model (RLM) for one metabolite

Description

Using rlm from MASS, this procedure fits a linear model using all the fragments

Usage

```
rmaFitUnit(u, maxit=5, mzEffect=TRUE, cls=NULL, fitSample=TRUE, fitOrCoef=c("coef", "fit"), TRANSFORM=1, transformed to the company of the
```

Arguments

u	a metabolite unit (list object with vectors mz and rt for m/z and retention times, respectively and a data element giving the fragmentxsample intensitity matrix)
maxit	maximum number of iterations (default: 5)
mzEffect	logical, whether to fit m/z effect (default: TRUE)
cls	class variable
fitSample	whether to fit individual samples (alternative is fit by group)

rmaFitUnit 25

fitOrCoef whether to return a vector of coefficients (default: "coef"), or an rlm object

("fit")

TRANSFORM function to transform the raw data to before fitting (default: log2)

Details

Fits a robust linear model.

Value

list giving elements of fragment and sample coefficients (if fitOrCoef="coef") or a list of elements from the fitting process (if fitOrCoef="fit")
