Package 'goProfiles'

March 26, 2013

Version 1.20.0
Title goProfiles: an R package for the statistical analysis of functional profiles
Author Alex Sanchez, Jordi Ocana and Miquel Salicru
Type Package
Depends Biobase, AnnotationDbi, GO.db
Suggests org.Hs.eg.db
Date 2010-10-04
Maintainer Alex Sanchez @ub.edu>
Description The package implements methods to compare lists of genes based on comparing the corresponding 'functional profiles'.
License GPL-2

goProfiles-package

Performs Gene Ontology based analysis using Functional Profiles.

Description

Performs Gene Ontology based analysis for gene sets or other type of biological identifiers which can be annotated in the Gene Ontology.

Details

Package: goProfiles
Type: Package
Version: 1.0
Pate: 2007.06.1

Date: 2007-06-12 License: GPL

Author(s)

Alex Sanchez and Jordi Ocana

References

Sanchez-Pla, A., Salicru M. and J.Ocana. Statistical methods for the analysis of high-throughput data based on functional profiles derived from the gene ontology. Journal of Statistical Planning and Inference, 2007.

See Also

goTools, GOstat, ontoTools, and other Bioconductor packages for GO based analysis

basicProfile Builds basic functional profile

Description

Compute basic functional profile for a given list of genes/GO identifiers, a given ontology at a given level of the GO

basicProfile 3

Usage

```
basicProfile(genelist, idType = "Entrez", onto = "ANY", level = 2, orgPackage = NULL, anotPackage = NULL, ord = TRUE, multilevels = NULL, empty.cats = TRUE, cat.names = TRUE, na.rm = TRUE)
```

Arguments

genelist List of genes on which the Profile has to be based

idType Type of identifiers for the genes. May be 'Entrez' (default), BiocProbes or

GoTermsFrame (see details below).

onto Ontology on which the profile has to be built

level Level of the ontology at which the profile has to be built

orgPackage Name of a Bioconductor's organism annotations package ('org.Xx-eg-db'). This

field must be provided if the gene list passed to the function is either a character vector of 'Entrez' (NCBI) identifiers or a character vector of probe names

anotPackage Name of Bioconductor's microarray annotations package. This field must be

provided if the gene list passed to the function is a character vector of probe

names

ord Set to 'TRUE' if the profile has to appear ordered by the category names

where the profile is built

empty.cats Set to 'TRUE' if empty categories should appear in the profile

cat.names Set to 'TRUE' if the profile has to contain the names of categories

na.rm Set to 'TRUE' if NAs should be removed

Details

The function admits three types of entries: Entrez ('Entrez'), Bioconductor probe set names ('BioCprobes') or a special type of data frames ('GOTermsFrames'). If the identifier type are 'BioCprobes' then an annotation package name must be provided too.

Value

An object of class GOProfile (one or more data frames in a list named by the ontologies)

Author(s)

Alex Sanchez

expandedProfile

4 compareGeneLists

Examples

```
\label{lem:contoning} \begin{split} & data(CD4Ids) \\ & CD4.MF.Profiles <-basicProfile(genelist=CD4LLids, onto='MF', level=2, orgPackage="org.Hs.eg.db") \\ & print(CD4.MF.Profiles) \end{split}
```

CD4Ids

Entrez identifiers for CD4-TCells example

Description

This dataset contains the entrez identifiers CD4EntrezIds and their associated GO Terms CD4GOTermsFrame and CD4GOTermsList corresponding to the list of differentially expressed genes in a study by Henkel et al.

Usage

data(CD4Ids)

Source

Hengel, R.L. and Thaker, V. and Pavlick, M.V. and Metcalf, J.A. and Dennis, G. Jr. and Yang, J. and Lempicki, R.A. and Sereti, I. and Lane, H.C. (2003). L-selectin (CD62L) expression distinguishes small resting memory CD4+ T cells that preferentially respond to recall antigen. J. Immunol., 170, 28-32. (2003)

Examples

data(CD4Ids)

compareGeneLists

Compares two lists of genes by building (expanded) profiles and comparing them

Description

This function wraps all the needed steps to compare two lists of genes following the methodology developed by Sanchez, Salicru and Ocan\~a (2007)

Usage

```
compareGeneLists(genelist1, genelist2, idType = "Entrez", onto = "ANY",\\ level = 2, orgPackage,\\ method = "lcombChisq", ab.approx = "asymptotic", confidence = 0.95, compareFunction="compareGOProfile", confidence = 0.95, compareGOProfile", confidence = 0.95
```

compareGeneLists 5

Arguments

genelist1 First gene set to be compared genelist2 Second gene set to be compared

idType Type of identifiers for the genes. May be 'Entrez' (default), BiocProbes or

GoTermsFrame. See the 'Details' section below

onto Ontology on which the profile has to be built

level Level of the ontology at which the profile has to be built

orgPackage Name of a Bioconductor's organism annotations package ('org.Xx-eg-db')

method The approximation method to the sampling distribution under the null hypothe-

sis specifying that the samples pn and qm come from the same population. See

the 'Details' section below

confidence The confidence level of the confidence interval in the result

ab.approx The approximation used for computing 'a' and 'b' coefficients (see details)

compareFunction

Allows to use 'fitGOProfile' (sample vs population) or 'compareGOProfiles'

(sample1 vs sample2)

... Other arguments for the methods 'basicProfile' or 'compareGoProfiles'

Value

The result of the comparison is a list with a variable number of arguments, depending for which ontologies has been performed the comparison. Each list member is an object of class 'htest' corresponding to the output of the function compareGOProfiles

Author(s)

Alex Sanchez

singh01EntrezIDs[1:500], level=2, onto='MF', orgPackage="org.Hs.eg.db")
print(prostateCompared)
# print(compSummary(prostateCompared))
```

6 compareGOProfiles

compareGOProfiles Comparison of lists of genes through their functional profiles	
--	--

Description

Compare two samples of genes in terms of their GO profiles pn and qm. Both samples may share a common subsample of genes, with GO profile pqn0. 'compareGOProfiles' implements some inferential procedures based on asymptotic properties of the squared euclidean distance between the contracted versions of pn and qm

Usage

```
compare GOP rofiles(pn, qm = NULL, pqn0 = NULL, n = ngenes(pn), m = ngenes(qm), n0 = ngenes(pqn0), met ab.approx = "asymptotic", confidence = 0.95, nsims = 10000, simplify = T, ...)
```

Arguments

pn	an object of class ExpandedGOProfile representing one or more "sample" expanded GO profiles for a fixed ontology (see the 'Details' section)
qm	an object of class ExpandedGOProfile representing one or more "sample" expanded GO profiles for a fixed ontology (see the 'Details' section)
pqn0	an object of class ExpandedGOProfile representing one or more "sample" expanded GO profiles for a fixed ontology (see the 'Details' section)
n	a numeric vector with the number of genes profiled in each column of pn. This parameter is included to allow the possibility of exploring the consequences of varying sample sizes, other than the true sample size in pn.
m	a numeric vector with the number of genes profiled in each column of qm.
n0	a numeric vector with the number of genes profiled in each column of pqn0.
method	the approximation method to the sampling distribution under the null hypothesis specifying that the samples pn and qm come from the same population. See the 'Details' section below
confidence	the confidence level of the confidence interval in the result
ab.approx	the approximation used for computing 'a' and 'b' coefficients (see details)
nsims	some inferential methods require a simulation step; the number of simulation replicates is specified with this parameter
simplify	should the result be simplified, if possible? See the 'Details' section
	Other arguments needed

Details

An object of S3 class 'ExpandedGOProfile' is, essentially, a 'data.frame' object with each column representing the relative frequencies in all observed node combinations, resulting from profiling a set of genes, for a given and fixed ontology. The row.names attribute codifies the node combinations and each data.frame column (say, each profile) has an attribute, 'ngenes', indicating the number of profiled genes. The arguments 'pn', 'qm' and 'pqn0' are compared in a column by column wise, recycling columns, if necessary, in order to perform max(ncol(pn),ncol(qm),ncol(pqn0)) comparisons (each comparison resulting in an object of class 'GOProfileHtest', an specialization of 'htest'). In

compareGOProfiles 7

order to be properly compared, these arguments are expanded by row, according to their row names. That is, the data arguments can have unequal row numbers. Then, they are expanded adding rows with zero frequencies, in order to make them comparable.

In the i-th comparison (i from 1 to max(ncol(pn),ncol(qm),ncol(pqn0))), the parameters n, m and n0 are included to allow the possibility of exploring the consequences of varying sample sizes, other than the true sample sizes included as an attribute in pn, qm and pqn0.

When qm = NULL, the genes profiled in pn are compared with a subsample of them, those profiled in pqn0 (compare a set of genes with a restricted subset, e.g. those overexpressed under a disease). In this case we take qm=pqn0. When pqn0 = NULL, two profiles with no genes in common are compared.

Let Pn and Qm correspond to the contracted functional profiles (the total counts or relative frequencies of hits in each one of the s GO categories being compared) obtained from pn and qm. If P stands for the "population" profile originating the sample profile Pn[,j], Q for the profile originating Qm[,j] and d(.) for the squared euclidean distance, if P != Q, the distribution of sqrt(nm/(n+m))(d(Pn[.j],Qm[.j])- d(P,Q))/se(d) is approximately standard normal, N(0,1). This provides the basis for the confidence interval in the result field icDistance. When P=Q, the asymptotic distribution of (nm/(n+m)) d(Pn[,j],Qm[,j]) corresponds to the distribution of a mixture of independent chi-square random variables, each one with one degree of freedom. The sampling distribution under H0 P=Q may be directly computed from this distribution (approximating it by simulation) (method="lcombChisq") or by a chi-square approximation to it, based on two correcting constants a and b (method="chisquare"). These constants are chosen to equate the first two moments of both distributions (the linear combination of chi-square random variables distribution and the approximating chi-square distribution). When method="chi-square", the returned test statistic value is the chi-square approximation (n d(pn[,j],qm[,j]) - b) / a. Then, the result field 'parameter' is a vector containing the 'a' and 'b' values and the number of degrees of freedom, 'df'. Otherwise, the returned test statistic value is (nm/(n+m)) d(Pn[,j],Qm[,j]) and 'parameter' contains the coefficients of the linear combination of chi-squares.

Value

A list containing max(ncol(pn),ncol(qm),ncol(pqn0)) objects of class 'GOProfileHtest', directly inheriting from 'htest' or a single 'GOProfileHtest' object if max(ncol(pn),ncol(qm),ncol(pqn0))==1 and simplify == T. Each object of class 'GOProfileHtest' has the following fields:

profilePn	the first contracted profile to compute the squared Euclidean distance
$\operatorname{profileQm}$	the second contracted profile to compute the squared Euclidean distance
statistic	test statistic; its meaning depends on the value of "method", see the 'Details' section.
parameter	parameters of the sample distribution of the test statistic, see the 'Details' section.
p.value	associated p-value to test the null hypothesis of profiles equality.
conf.int	asymptotic confidence interval for the squared euclidean distance. Its attribute "conf.level" contains its nominal confidence level.
estimate	squared euclidean distance between the contracted profiles. Its attribute "se" contains its standard error estimate.
method	a character string indicating the method used to perform the test.
data.name	a character string giving the names of the data.
alternative	a character string describing the alternative hypothesis (always 'true squared

Euclidean distance between the contracted profiles is greater than zero'

Examples

compare Profiles Lists

Compares two of expanded profiles

Description

This function compares two lists ("sensu R lists") of expanded profiles by successive calls to function compareGOProfiles following the methodology developed by Sanchez, Salicru and Ocan\~a (2007)

Usage

```
compare Profiles Lists (expanded 1, expanded 2, common. expanded = NULL, relation Type, method = "lcombChisq", ab.approx = "asymptotic", confidence = 0.95, ...)
```

Arguments

 $\begin{array}{ll} expanded 1 & First \ expanded \ profile \ to \ be \ compared \\ expanded 2 & Second \ expanded \ profile \ to \ be \ compared \\ common.expanded \end{array}$

Expanded profile made from the genes appearing in both lists of genes

relationType Type of relation between gene lists compared through the expanded profiles. It can be INCLUSION, INTERSECTION or DISJOINT

compSummary 9

method	The approximation method to the sampling distribution under the null hypothesis specifying that the samples pn and qm come from the same population. See the 'Details' section below
confidence	The confidence level of the confidence interval in the result
ab.approx	The approximation used for computing 'a' and 'b' coefficients (see details)

... Other arguments for the methods 'basicProfile' or 'compareGoProfiles'

Value

The result of the comparison is a list with a variable number of arguments, depending for which ontologies has been performed the comparison. Each list member is an object of class 'htest' corresponding to the output of the function compareGOProfiles

Author(s)

Alex Sanchez

compareGeneLists, expandedProfile

Examples

```
#require(goProfiles)
#data(ProstateIds)
#expandedWelsh <- expandedProfile(welsh01EntrezIDs[1:100], onto="MF",

# level=2, orgPackage="org.Hs.eg.db")
#expandedSingh <- expandedProfile(singh01EntrezIDs[1:100], onto="MF",

# level=2, orgPackage="org.Hs.eg.db")
#commonGenes <- intersect(welsh01EntrezIDs[1:100], singh01EntrezIDs[1:100])
#commonExpanded <- expandedProfile(commonGenes, onto="MF", level=2, orgPackage="org.Hs.eg.db")
#comparedMF<- compareProfilesLists (expandedWelsh, expandedSingh, commonExpanded, relationType="COMMON #print(comparedMF)
#print(compSummary(comparedMF))
```

compSummary

This function returns a brief summary of the comparison between two (expanded) profiles.

Description

Function to return a brief summary of the comparison between two (expanded) profiles.

Usage

```
compSummary(l, decs = 6)
```

10 contractedProfile

Arguments

l A list of comparison results as returned by a call to compareGenelists decs Number of decimal places to use in the output

Value

A data frame with the summarized results of each comparison. The values contained are: Sqr.Eucl.Dist: The squared euclidean distance, Standard Err: The standard error estimate, pValue p value of the test, low conf.intLower value for the desired confidence interval, up conf.intUpper value for the desired condfidence interval.

Examples

contractedProfile

Converts an expanded GO profile into a basic (contracted) GO profile

Description

Converts an object of class 'ExpandedGOProfile', or assimilable to it, in an object of class 'Basic-GOProfile'

Usage

```
contractedProfile(prof, nams = NULL) ## S3 method for class 'ExpandedGOProfile' contractedProfile(prof, nams = NULL) ## Default S3 method: contractedProfile(prof, nams = NULL)
```

Arguments

prof an expanded GO profile, i.e. and object of class 'ExpandedGOProfile', or a

numeric vector assimilable to an expanded profile, see the "details" section

nams optionally, the names of the annotated combinations of GO nodes whose fre-

quency is represented in the expanded profile, see the "details" section

conversionFunctions 11

Details

Given a list of n genes, and a set of s GO nodes X, Y, Z, ... in a given ontology (BP, MF or CC), its associated (contracted) "profile" is the frequencies vector (either absolute or relative frequencies) of annotations or hits of the n genes in each node. For a given node, say X, this frequency includes all annotations for X alone, for X and Y, for X and Z and so on. Thus, as relative frequencies, its sum is not necessarily one, or as absolute frequencies their sum is not necessarily n. Basic contracted profiles are represented by objects of S3 class 'BasicGOProfile'. On the other hand, an "expanded profile" corresponds to the frequencies in ALL OBSERVED NODE COMBINATIONS. That is, if n genes have been profiled, the expanded profile stands for the frequency of all hits EXCLUSIVELY in nodes X, Y, Z, ..., jointly with all hits simultaneously in nodes X and Y (and only in X and Y), simultaneously in X and Z, in Y and Z, ..., in X and Y and Z (and only in X,Y,Z), and so on. Thus, their sum is one. Expanded profiles are represented by objects of S3 class 'ExpandedGOProfile'. The generic function 'contractedProfile' "contracts" an expanded profile, either represented by a 'ExpandedGOProfile' object or a numeric vector interpretable as an expanded profile, in order to obtain its contracted profile representation.

The rownames attribute of an 'ExpandedGOProfile' or, equivalently, the names attribute of a vector representing an expanded profile, or the names argument, must represent the GO nodes combinations separating the node names with dots, ".", for example: "X", "Y", "Z", "X.Y", "X.Z", "Y.Z", "X.Y.Z" and so on.

Value

An object of class 'BasicGOProfile' the contracted profile representation of the expanded profile

Author(s)

Jordi Ocana

Examples

conversionFunctions

Functions to transformconvert objects between different types

Description

These functions transform data from one classtype into another, or pack simple processes such as compute the profiles needed for one annotations package.

12 conversionFunctions

Usage

```
as. GOTerms. frame (myGOTermsList, na.rm=TRUE)\\ as. GOTerms. list (genelist, probeType, orgPackage=NULL, anotPkg=NULL, onto="any", na.rm=TRUE)\\ BioCpack2EntrezIDS (anotPkg, na.rm=TRUE)\\ BioCpack2Profiles (anotPkg, orgPackage, level=2, na.rm=TRUE, expanded=FALSE)\\ BioCprobes2Entrez (probeslist, anotPkg, na.rm=TRUE)\\ GOTermsFrame2GOTermsList (myGOTermsFrame, evid=FALSE)\\
```

Arguments

myGOTermsList

GOTermsList object to transform

myGOTermsFrame

GOTermsFrame object to transform

genelist List of genes (Entrez Ids) to transform

evid Type of evidence supporting the selected GO Terms

na.rm Flag indicating if those ids returning NA must be removed from the output

probeType Type of probes to transform into Entrez Ids
probeslist List of probes to transform into Entrez Ids

orgPackage Name of the organism ('org.Xx.eg.db') annotation package

anotPkg Name of the chip annotation package level GO level at which the profile is built

onto ontology

expanded Flag to decide if an expanded profile has to be computed

Details

Not yet available

Value

Every function returns a transformed object or a list of computed profiles

Author(s)

Alex Sanchez

Examples

```
data(CD4Ids)
myGOTermsList <- GOTermsList(CD4LLids[1:5], orgPkg="org.Hs.eg.db")
myGOTermsFrame<-- as.GOTerms.frame(myGOTermsList, na.rm=TRUE)
GOTermsFrame2GOTermsList(myGOTermsFrame, evid=FALSE)
```

drosophila 13

drosophila

Entrez identifiers for genes related with an eye mutation in drosophila

Description

```
Entrez identifiers for genes related with an eye mutation in drosophila.
```

```
ostrinIds List of genes in Entrez, generated by Ostrin et al.
michaudIds List of genes in Entrez, generated by Michaud et al.
drosophilaIds List of Drosophila genes in Entrez.
```

Usage

```
data(drosophila)
```

Format

Each dataset is a character vector with a different number of elements which (should) correspond to valid Entrez identifiers

Examples

```
data(drosophila)
```

equivalent GOP rofiles

Are two lists of genes equivalent in terms of their Gene Ontology profiles?

Description

Performs an equivalence test based on the squared Euclidean distance between the Gene Ontology profiles of two lists of genes. Equivalence is declared if the upper limit d.sup of a one-sided confidence interval [0, d.sup] for the distance is lesser than the equivalence limit d0.

Usage

```
equivalentGOProfiles(goObject, ...)

## S3 method for class 'GOProfileHtest'
equivalentGOProfiles(goObject, equivEpsilon = 0.05, d0 = NULL, confidence = NULL, ...)

## S3 method for class 'list'
equivalentGOProfiles(goObject, ...)

## S3 method for class 'ExpandedGOProfile'
equivalentGOProfiles(goObject, qm=NULL, pqn0=NULL,

n = ngenes(goObject), m = ngenes(qm), n0 = ngenes(pqn0),
confidence = 0.95,
equivEpsilon = 0.05, d0 = NULL,
simplify = FALSE, ...)

## Default S3 method:
equivalentGOProfiles(goObject, ...)
```

14 equivalentGOProfiles

Arguments

goObject an object related to GO profiles or comparisons between them
qm an expanded GO profile, i.e. and object of class 'ExpandedGOProfile'
pqn0 an expanded GO profile, i.e. and object of class 'ExpandedGOProfile'

n a numeric vector with the number of genes profiled in each column of goObject.

This parameter is included to allow the possibility of exploring the consequences

of varying sample sizes, other than the true sample size in goObject.

m a numeric vector with the number of genes profiled in each column of qm.

n0 a numeric vector with the number of genes profiled in each column of pqn0.

confidence the nominal confidence level of the one-sided confidence interval on the distance

d0 a positive value specifying the equivalence limit

equivEpsilon a positive value used to compute 'd0' if it is not directly available simplify should the result be simplified, if possible? See the 'Details' section further arguments, tipically the same than to 'compareGOProfiles'

Details

An object of S3 class "ExpandedGOProfile" is, essentially, a "data.frame" object with each column representing the relative frequencies in all observed node combinations, resulting from profiling a set of genes, for a given and fixed ontology. The 'row.names' attribute codifies the node combinations and each "data.frame" column (say, each profile) has an attribute, 'ngenes', indicating the number of profiled genes.

In the 'ExpandedGOProfile' interface, the arguments 'goObject', 'qm' and 'pqn0' are compared in a column by column wise, recycling columns, if necessary, in order to perform max(ncol(goObject),ncol(qm),ncol(pqn0)) equivalence tests (each test resulting in an object of class 'htest'). In order to be properly tested, these arguments are expanded by row, according to their row names. That is, the data arguments can have unequal row numbers. Then, they are expanded adding rows with zero frequencies, in order to make them comparable. In the i-th comparison (i from 1 to max(ncol(goObject),ncol(qm),ncol(pqn0))), the parameters n, m and n0 are included to allow the possibility of exploring the consequences of varying sample sizes, other than the true sample sizes included as an attribute in goObject, qm and pqn0. When qm = NULL, the genes profiled in goObject are compared with a subsample of them, those profiled in pqn0 (is there equivalence between a set of genes and a restricted subset, e.g. those overexpressed under a disease, in terms of their profiles?). When pqn0 = NULL, an equivalence test between two profiles with no genes in common is performed.

In the 'GOProfileHtest' interface, the one-sided confidence interval for the squared Euclidean distance is computed from the distance and its standard error stored in the corresponding fields of the argument goObject, itself typically an object of class 'GOProfileHtest' resulting from a call to 'compareGOProfiles' with simplify=T.

In the 'list' interface, the argument goObject is intended to be a list of objects of class 'GOProfileHtest' typically resulting from a call to 'compareGOProfiles' with simplify=F. The call to the method is iterated along the list, and the one-sided confidence interval for the squared Euclidean distance is computed from the distance and its standard error stored in the corresponding fields of all the members of the list.

In the default interface, the 'goObject' argument is previously converted into an object of class 'ExpandedGOProfile' and then this interface is used.

If the argument 'd0' is not provided it is computed as $d0 < -s * equivEpsilon^2$, where 's' stands for the number of non empty GO nodes in any of the GO profiles being compared.

equivSummary 15

Value

In the 'ExpandedGOProfile' and 'list' interfaces, the result is a list of objects of class "htest" or a single "htest" object if there is only one object in the list and simplify == T. In the other interfaces, the result is a single "htest" object. Each one of these "htest" objects has the following fields:

statistic test statistic, (distance - d0) / se

parameter d0 and the sample sizes (number of genes) n and m

p.value associated p-value to test the null hypothesis of profiles inequivalence

conf.int asymptotic one-sided confidence interval for the squared euclidean distance. Its

attribute "conf.level" contains its nominal confidence level.

estimate squared euclidean distance between the contracted profiles. Its attribute "se"

contains its standard error estimate

data.name a character string giving the names of the data

alternative a character string describing the alternative hypothesis (always 'Equivalence or

similarity, true squared Euclidean distance between the contracted profiles is

less than d0'

Author(s)

Jordi Ocana

'compareGOProfiles'

Examples

equivSummary

This function returns a brief summary of the equivalence test between two profiles.

Description

Function to return a brief summary of the equivalence test between two profiles. If In its current version it is better that equivalentGOProfiles is called with option simplify set to FALSE before equivSummary can be used

16 expandedLevel

Usage

```
equivSummary(l, decs = 6)
```

Arguments

l A list of comparison results as returned by a call to compareGenelists decs Number of decimal places to use in the output

Value

A data frame with the summarized results of each comparison. The values contained are: Sqr.Eucl.Dist: The squared euclidean distance, Standard Err: The standard error estimate, pValue p value of the equivalence test, up conf.intUpper value for the desired condfidence interval. d0Threshold value for equivalence test. Equivalent?Numerical value set to 1 if profiles can be considered equivalent and to zero if they cannot.

expandedLevel

Function to create expanded levels which can contain GO Terms at different GO levels

Description

This function, combined with function expandTerm, allows to create mixed levels which can contain terms belonging to different GO levels. Specifically one can take one (or several, but one by one) term at a given GO level and expand it into its children terms using function expandTerm and then combine them into a new level using this function.

expandedProfile 17

Usage

```
\begin{array}{l} {\rm expandedLevel(LevelTerms, \, Term2Expand, \, onto)} \\ {\rm expandTerm(GOTerm, \, onto)} \end{array}
```

Arguments

LevelTerms Other terms which have not been expanded, and will be combined with the ex-

panded ones

Term2Expand The GO term which will be substituted by its children terms

GOTerm The GO term which will be substituted by its children terms

onto The ontology ('MF','BP','CC'

Value

The value returned is the vector combining the original terms with the children of the term that had to be expanded.

expandedProfile

Builds expanded profiles

Description

Expanded profiles are used mainly for comparison of profiles based on the theory developed by Sanchez et al (2007) (see references)

Usage

```
expanded
Profile(genelist, idType = "Entrez", onto = "ANY", level = 2,
orgPackage=NULL, anotPackage=NUL multilevels = NULL, ord = TRUE, na.rm = TRUE, percentage = TRUE)
```

18 expandedProfile

Arguments

genelist List of genes on which the Profile has to be based

idType Type of identifiers for the genes. Use 'Entrez' preferably

onto Ontology on which the profile has to be built

level Level of the ontology at which the profile has to be built

orgPackage Name of a Bioconductor's organism annotations package ('org.Xx-eg-db'). This

field must be provided if the gene list passed to the function is either a character vector of 'Entrez' (NCBI) identifiers or a character vector of probe names

anotPackage Name of Bioconductor annotations package. This field must be provided if the

gene list passed to the function is a character vector of probe names

ord Set to 'TRUE' if the profile has to appear ordered by the category names

multilevels If it is not NULL it must be a vector of GO categories that defines the level at

where the profile is built

na.rm Set to 'TRUE' if NAs should be removed

percentage Set to 'TRUE' if the profile must be built using percentages

Details

The function admits three types of entries: Entrez ('Entrez'), Bioconductor probe set names ('BioCprobes') or a special type of data frames ('GOTermsFrames'). If the identifier type are 'BioCprobes' then an annotation package name must be provided too.

Value

An object of class GOProfile containing an expanded profile

Author(s)

Alex Sanchez

fisherGOProfiles	GO Class-by-class Fisher tests in lists of genes characterized by their
	functional profiles

Description

Given two lists of genes, both characterized by their frequencies of annotations (or "hits") in the same set of GO nodes (also designated as GO terms or GO classes), for each node determine if the annotation frequencies depart from what is expected by chance. The annotation frequencies are specified in the "GO profiles" arguments pn, qm and pn. Both samples may share a common subsample of genes, with GO profile pqn0. The analysis is based on the Fisher's exact test, as is implemented by fisher.test R function, followed by p-value adjustment for multitesting based on function p.adjust. Usually, this function will be called after a significant result on compareGOProfiles which performs global (all GO nodes simultaneously) profile comparisons (with better type I and type II error control), to identify the more rellevant nodes.

Usage

```
fisherGOProfiles(pn, ...)
## S3 method for class 'numeric'
fisherGOProfiles(pn, qm=NULL, pqn0=NULL,
    n = ngenes(pn), m = ngenes(qm), n0 = ngenes(pqn0),
    method = "BH", simplify=T, expanded=F, ...)
## S3 method for class 'matrix'
fisherGOProfiles(pn, n, m, method = "BH", ...)
## S3 method for class 'BasicGOProfile'
fisherGOProfiles(pn, qm=NULL, pqn0=NULL,
    method = "BH", goIds=T, ...)
## S3 method for class 'ExpandedGOProfile'
fisherGOProfiles(pn, qm=NULL, pqn0=NULL,
    method = "BH", simplify=T, ...)
```

Arguments

pn	an object of class BasicGOProfile or ExpandedGOProfile representing a "sample" GO profile for a fixed ontology, or a numeric vector interpretable as a GO profile (expanded or not), or a two-dimensional frequency matrix (see the 'Details' section). This is a required argument
qm	similarly, an object representing a "sample" GO profiles for a fixed ontology
pqn0	an object representing a "sample" GO profile for a fixed ontology
n	the number of genes profiled in pn
m	the number of genes profiled in qm
n0	the number of genes profiled in pqn0
method	the p-values adjusting method for multiple comparisons; the same possibilities as in standard R function p.adjust
expanded	boolean; are these numeric vectors representing expanded profiles?
simplify	should the result be simplified, if possible? See the 'Details' section
goIds	if TRUE, each node is represented by its GO identifier
•••	other arguments (to be passed to p.adjust or fisher.test functions)

20 fisherGOProfiles

Details

Given a list of n genes, and a set of s GO classes or nodes X, Y, Z, ... in a given ontology (BP, MF or CC), its associated ("contracted" or "basic") "profile" is the absolute frequencies vector of annotations or hits of the n genes in each one of the s GO nodes. For a given node, say X, this frequency includes all annotations for X alone, for X and Y, for X and Z and so on. Thus, as relative frequencies, its sum is not necessarily one, or as absolute frequencies their sum is not necessarily n. On the other hand, an "expanded profile" corresponds to the relative frequencies in ALL NODE COMBINATIONS. That is, if n genes have been profiled, the expanded profile stands for the frequency of all hits EXCLUSIVELY in node X, exclusively in node Y, exclusively in Z, ..., jointly with all hits simultaneously in nodes X and Y (and only in X and Y), simultaneously in X and Z, in Y and Z, ..., in X and Y and Z (and only in X,Y,Z), and so on. Thus, their sum is one.

Let n, m and n0 designate the total number of genes profiled in pn, qm and pqn0 respectively. According to these profiles, n[i], m[i] and n0[i] genes are annotated for node 'i', $i=1,\ldots,s$. Note that the sum of all the n[i] not necessarily equals n and so on. If not NULL, pqn0 stands for the profile of the n0 genes common to the gene lists that gave rise to pn and pqn. fisherGOProfiles builds a pqn absolute frequencies matrix

```
GO node 1 N[1,1] N[1,2]
GO node 2 N[2,1] N[2,2]
... ...
GO node s N[2,1] N[s,2]
```

with column totals N1 and N2 (not necessarily equal to the column sums) and performs a Fisher's exact test over each one of the 2x2 tables

```
GO node i N[i,1] N[i,2]
All nodes except i N1 - N[i,1] N2 - N[i,2]
```

followed by a p-value correction for multiplicity in testing. If pqn0 is NULL, then both gene lists do not have any genes in common, N[i,1] = n[i] and N[i,2] = m[i], and N1 = n, N2 = m, n0 = 0. Otherwhise (if pqn0 is not NULL) N[i,1] = n[i] - n0[i], N1 = n - n0 and N[i,2] = n0[i], N2 = n0 if qm is NULL, or N[i,2] = m[i], N2 = m if qm is not NULL.

In other words, this function provides a general setting for diverse, common in practice, situations where a node-by-node analysis is required. When pqn0 = NULL, two lists with no genes in common are compared. Otherwise, when qm = NULL, the genes profiled in pqn are compared with a subsample of them, those profiled in pqn0 (a set of genes vs a restricted subset, e.g. those overexpressed under a disease). Finally, if both arguments qm and pqn0 are not NULL (pn is always required) two gene lists with some genes in common are analised.

If both qm and pqn0 are NULL, pn should correspond to an absolute frequencies matrix with s rows and 2 columns.

The arguments n, m or n0 are only required in case of numeric vectors or matrices specifying profiles but lacking the 'ngenes' attribute.

Value

A list containing $\max(\text{ncol}(pn), \text{ncol}(qm), \text{ncol}(pqn0))$ p-values numeric vectors, or a single p-values vector if $\max(\text{ncol}(pn), \text{ncol}(qm), \text{ncol}(pqn0)) == 1$ and simplify == T.

fitGOProfile Does a "sample" GO profile 'pn', observed in a sample of 'n' genes, fit a "population" or "model" p0?

Description

'fitGOProfile' implements some inferential procedures to solve the preceding question. These procedures are based on asymptotic properties of the squared euclidean distance between the contracted versions of pn and p0

Usage

```
fit GOProfile (pn, p0, n = ngenes (pn), method = "lcombChisq", ab.approx = "asymptotic", confidence = 0.95, ns = 1000 (pn, p0, n) = 1000 (pn, p0
```

Arguments

pn	an object of class ExpandedGOProfile representing one or more "sample" expanded GO profiles for a fixed ontology (see the 'Details' section)
p0	an object of class ExpandedGOProfile representing one or more "population" or "theoretical" expanded GO profiles (see also the 'Details' section)
n	a numeric vector with the number of genes profiled in each column of pn. This parameter is included to allow the possibility of exploring the consequences of varying sample sizes, other than the true sample size in pn
method	the approximation method to the sampling distribution under the null hypothesis " $p = p0$ ", where p is the 'true' population profile originating each column of pn. See the 'Details' section below

22 fitGOProfile

ab.approx the method used to compute the constants 'a' and 'b' described in the paper. See

the 'Details' section

confidence the confidence level of the confidence interval in the result

nsims some inferential methods require a simulation step; the number of simulation

replicates is specified with this parameter

simplify should the result be simplified, if possible? See the 'Details' section

Details

An object of class 'ExpandedGOProfile' is, essentially, a 'data.frame' object with each column representing the relative frequencies in all observed node combinations, resulting from profiling a set of genes, for a given and fixed ontology. The row.names attribute codifies the node combinations and each data.frame column (say, each profile) has an attribute, 'ngenes', indicating the number of profiled genes. (Actually, the 'ngenes' attribute of each 'p0' column is ignored and is taken as if it were infinite, 'Inf'.) The arguments 'pn' and 'p0' are compared in a column by column wise, recycling columns, if necessary, in order to perform max(ncol(pn),ncol(p0)) comparisons (each comparison resulting in an object of class 'htest'). In order to be properly compared, 'pn' and 'p0' are expanded by row, according to their row names. That is, both arguments can have unequal row numbers. Then, they are expanded adding rows with zero frequencies, in order to make them comparable.

In the i-th comparison (i from 1 to max(ncol(pn),ncol(p0))), if p stands for the profile originating the sample profile pn[,i] and d(,) for the squared euclidean distance, if p != p0[,i], the distribution of $polenoide{sqrt}(n)(d(pn[,i],p0[,i]) - d(p,p0[,i]))$ /se is approximately standard normal, $polenoide{sqrt}(n)(d(pn[,i],p0[,i]) - d(p,p0[,i]))$ /se is approximately standard normal, $polenoide{sqrt}(n)(n,j)$. This provides the basis for the confidence interval in the result field conf.int. When p=p0[,i], the asymptotic distribution of $polenoide{sqrt}(n)(n,j)$ is the distribution of a linear combination of independent chi-square random variables, each one with one degree of freedom. This sampling distribution may be directly computed (approximating it by simulation, method="lcombChisq") or approximated by a chi-square distribution, based on two correcting constants a and b (method="chi-square"). These constants are chosen to equate the first two moments of both distributions (the distribution of a linear combination of chi square variables and the approximating chi-square distribution). When method="chi-square", the returned test statistic value is the chi-square approximation ($polenoide{sqrt}(n)$) of degrees of freedom, 'df'. Otherwise, the returned test statistic value is $polenoide{sqrt}(n)$ of values and the number of degrees of freedom, 'df'. Otherwise, the returned test statistic value is $polenoide{sqrt}(n)$ and 'parameter' contains the coefficients of the linear combination of chi-squares

Value

A list containing $\max(\text{ncol}(pn), \text{ncol}(p0))$ objects of class 'htest', or a single 'htest' object if ncol(pn) == 1 and ncol(p0) == 1 and simplify == T. Each 'htest' object has the following fields:

statistic	test statistic; its meaning depends on the value of "method", see the 'Details' section
parameter	parameters of the sample distribution of the test statistic, see the 'Details' section
p.value	associated p-value to test the null hypothesis "pn[,i] is a random sample taken from p0[,i]"
conf.int	asymptotic confidence interval for the squared euclidean distance. Its attribute "conf.level" contains its nominal confidence level
estimate	squared euclidean distance between the contracted pn and p0 profiles. Its attribute "se" contains its standard error estimate
method	a character string indicating the method used to perform the test

GOTermsList 23

data.name a character string giving the names of the data

alternative a character string describing the alternative hypothesis

Author(s)

compareGOProfiles

Examples

GOTermsList

Functions to create and manage lists of GO terms associated with a vector of 'Entrez' identifiers

Description

These functions prepare data to be processed by the 'basicProfile' function. To create a profile a set of GOterms belonging to one or more ontologies is needed The terms belonging to each gene must be given separately so that they can be counted. This function queries the environment 'GOENTREZID2GO' with the vector of Entrez terms and formats the output into a list whose components -one per Entrez term- contain the most specific GO identifiers associated with this term.

Usage

```
\label{eq:gotense} \begin{split} & GOTermsList(LLids,\,onto="any",\,evid="any",\,na.rm=TRUE,\,orgPkg\,\,)\\ & getAncestorsLst(GOtermslist,\,onto,\,unique.ancestor=TRUE,\,na.rm=TRUE,\,combine=TRUE)\\ & getGOLevel(onto,\,level) \end{split}
```

Arguments

LLids	Character vector of Entrez (formerly Locuslink identifiers)
onto	ontology to be queried using the genes list
evid	type of evidence supporting the selected GO Terms
na.rm	flag indicating if those ids returning NA must be removed from the output

24 hugoIds

orgPkg Organism annotation package ('org.Xx.eg.db') required to obtain the GO terms

associated with the Entrez identifiers

GOtermslist List produced by a call to function GOTermsList

unique.ancestor Flag to remove repeated ancestor identifiers

combine Flag to combine ancestors

level GO level at which the profile is built

Details

During the call to this function there may appear two types of NAs.

By one side if a name is not mapped in LocusLink this yields an NA that must be eliminated because nothing can be found through LL about this name

By another side if a gene is identified in LL but yields NA it seems to mean that it is not mapped in the GO

This may be eliminated but it may be worth the pity to keep track of them and to put these terms in an 'Seemingly unnanotated' category. In the case that its number was very high it migt suggest reviewing the list or reconsidering the results.

Value

A list whose components -one per Entrez term- are character vectors with the most specific GO identifiers associated with this term

```

mergeProfilesLists

Combines two lists of profiles into one

Description

Combines two lists of profiles, that is two lists with three components, 'MF', 'BP', 'CC' into a single one.

Usage

```
mergeProfilesLists(profilesList1, profilesList2, emptyCats = F, profNames = NULL)
```

Arguments

profilesList1 First list to combine

profilesList2 Second list to combine

emptyCats Boolean. Set to TRUE if there are empty categories that should be accounted for in any of the profiles

profNames Names for the profiles (optional). If missing they are set to 'Frequency-1', 'Frequency-2', etc.

Value

A list of profiles with more than one column each.

Author(s)

Alex Sanchez

Examples

```
\label{lem:continuous} $$ \text{data}(\text{prostateIds})$ $$ \text{data}(\text{prostateIds})$ $$ \text{welsh.MF} <-$ \text{basicProfile} (\text{welsh01EntrezIDs}[1:100], \text{onto}="\text{MF"}, \text{level}=2, \text{orgPackage}="\text{org.Hs.eg.db"})$ $$ \text{singh.MF} <-$ \text{basicProfile} (\text{singh01EntrezIDs}[1:100], \text{onto}="\text{MF"}, \text{level}=2, \text{orgPackage}="\text{org.Hs.eg.db"})$ $$ \text{plotProfiles}(\text{welsh.MF}, \text{Functional profiles} \text{ for Welsh dataset'}, \text{percentage}=\text{TRUE})$ $$ \text{welsh.singh.MF} <-\text{mergeProfilesLists}(\text{welsh.MF}, \text{singh.MF}, \text{profNames}=c("\text{Welsh"}, "\text{Singh"}))$ $$
```

26 ngenes

ngenes	Returns the number of genes that lead to this GO profile (an object of
	class ExpandedGOProfile, BasicGOProfile or assimilable to them)

Description

The information contained in one or more lists of genes may be summarized by their GO profiles, that is to say, the absolute or relative frequencies of annotations or hits in all the classes or nodes of a given leven in a given GO ontology, or by the corresponding frequencies in a selected set of nodes (possibly belonging to more than one GO level but not hierarchically related). This function returns the number of genes in each list that were annotated to compute the profiles

Usage

```
\begin{array}{l} \operatorname{ngenes}(pn,\,i{=}\operatorname{NULL})\\ \#\#\operatorname{Default}\,S3\operatorname{method};\\ \operatorname{ngenes}(pn,\,i{=}\operatorname{NULL})\\ \#\#\operatorname{S3}\operatorname{method}\,\mathrm{for}\,\,\mathrm{class}\,\,\mathrm{'numeric'}\\ \operatorname{ngenes}(pn,\,i{=}\operatorname{NULL})\\ \#\#\operatorname{S3}\operatorname{method}\,\mathrm{for}\,\,\mathrm{class}\,\,\mathrm{'matrix'}\\ \operatorname{ngenes}(pn,\,i{=}\operatorname{NULL})\\ \#\#\operatorname{S3}\operatorname{method}\,\mathrm{for}\,\,\mathrm{class}\,\,\mathrm{'ExpandedGOProfile'}\\ \operatorname{ngenes}(pn,\,i{=}\operatorname{NULL})\\ \#\#\operatorname{S3}\operatorname{method}\,\,\mathrm{for}\,\,\mathrm{class}\,\,\mathrm{'BasicGOProfile'}\\ \operatorname{ngenes}(pn,\,i{=}\operatorname{NULL})\\ \end{array}
```

Arguments

pn	an object of class ExpandedGOProfile or BasicGOProfile representing one or
	more "sample" expanded GO profiles for a fixed ontology, or a numeric vector
	interpretable as a GO profile (expanded or not), or a frequency matrix (see the 'Details' section)
i	i-th profile in the case of more than one profiles. A vector with the number of genes of all profiles is returned if this argument is absent

Details

Given a list of n genes, and a set of s GO nodes X, Y, Z, ... in a given ontology (BP, MF or CC), its associated (contracted) "basic profile" is the frequencies vector (either absolute or relative frequencies) of annotations or hits of the n genes in each node. For a given node, say X, this frequency includes all annotations for X alone, for X and Y, for X and Z and so on. Thus, as relative frequencies, its sum is not necessarily one, or as absolute frequencies their sum is not necessarily n. On the other hand, an "expanded profile" corresponds to the frequencies in ALL OBSERVED NODE COMBINATIONS. That is, if n genes have been profiled, the expanded profile stands for the frequency of all hits EXCLUSIVELY in nodes X, Y, Z, ..., jointly with all hits simultaneously in nodes X and Y (and only in X and Y), simultaneously in X and Z, in Y and Z, ..., in X and Y and Z (and only in X,Y,Z), and so on. Thus, their sum is one.

An object of S3 class 'ExpandedGOProfile' is, essentially, a 'data frame' object with each column representing an expanded profile. The row.names attribute codifies the node combinations and each data frame column (say, each profile) has an attribute, 'ngenes', indicating the number of profiled genes.

omimIds 27

Value

A vector with the number of genes annotated in one or more GO profiles

```

omimIds

Entrez identifiers for disease-related genes in the OMIM database

Description

Entrez identifiers for several lists of genes related with human disease.

- diseaseIds contains the Entrez identifiers corresponding to disease-related genes found in the OMIM database. This list has been manually curated by Nuria Lopez-Bigas et al. who kindly provided it to us.
- morbidmapIds contains the Entrez identifiers for all the genes in the morbidmap table. This list would correspond to disease-related genes if there had been no manual curation, as in the previous list ('diseaseIds').
- dominantIds ontains the Entrez identifiers for dominant genes after manual curation by Nuria Lopez-Bigas who has kindly allowed us to include them in the package.
- recessiveIds contains the Entrez identifiers for recessive genes after manual curation by Nuria Lopez-Bigas who has kindly allowed us to include them in the package.
- dominantIdsEBI contains the Entrez identifiers for dominant genes in the EBI version of the OMIM database recovered using SRS with the term 'dominant' in the KEYWORDS field.
- recessiveIdsEBI contains the Entrez identifiers for recessive genes in the EBI version of the OMIM database recovered using SRS with the term 'recessive' in the KEYWORDS field.
- dominantIdsNCBI contains the Entrez identifiers for dominant genes in the NCBI version of the OMIM database recovered using ENTREZ with the term 'dominant' in the CLINICAL field.
- recessiveIdsNCBI contains the Entrez identifiers for recessive genes in the NCBI version of the OMIM database recovered using ENTREZ with the term 'recessive' in the CLINICAL field.

28 plotProfiles

Usage

```
data(omimIds)
```

Format

Each dataset is a character vector with a different number of elements which (should) correspond to valid Entrez identifiers

Details

Lopez-Bigas et al. analyzed the distribution of functional categories in genes causing disease in human. They did several comparisosn which can also be done using goProfiles. In order to perform these comparisons we first tried to obtain the same lists of genes using standard database browsers, such as 'SRS', at the European Bioinformatics Institute, or 'Entrez', at the National Center for Biotechnological Information. Curiously both approaches provided very different lists so we asked the authors for their data and they kindly provided them to us. In order to facilitat the use of functions included in goProfiles we have trimmed the list of recessive and dominant genes so that (i) They become exclussive (no gene belows to both lists) (2) They are both included in the diseaseIds list. This eliminated 39 genes (out of 639) from the list of recessive genes and 52 genes (out of 414) from the list of dominant genes

Plot functional profiles

Description

Plots basic functional profiles created with the 'basicProfile' instruction. If several profiles have to be plot together they must be first merged using the 'mergeProfiles' function. The labels of the Y-axis of the plots are the descriptions of the GO Terms. If the label is longer than 20 characters it is truncated and ended by three dots.

Usage

```
plotProfiles(aProf, aTitle = "Functional Profile", anOnto = NULL, percentage = FALSE, HORIZVERT = TRUE, legendText = NULL, colores = c("white", "red"), multiplePlots = F, multipleWindows
```

printProfiles 29

Arguments

aProf Functional profile to plot aTitle Title for the figures

anOnto Ontology (to appear in the title)

percentage Plot absolute or relative frequencies (not summing to 100)

HORIZVERT Plot horizontal or vertical bars legendText Text of the legend for the plot

colores Colors to be used

multiplePlots Plot all profiles for a given dataset in one figure

 $\operatorname{multipleWindows}$

Open a new window after each plot

labelWidth Width of Y axis labels (Names of GO categories) in the plot
... Other graphical parameters that should be passed for plotting

Value

The plot

Examples

```
\label{lem:continuous} $$ \text{data}(\text{prostateIds})$ $$ \text{data}(\text{prostateIds})$ $$ \text{welsh.MF} <-$ \text{basicProfile} (\text{welsh01EntrezIDs}[1:100], \text{onto}=\text{"MF"}, \text{level}=2, \text{orgPackage}=\text{"org.Hs.eg.db"})$ $$ \text{singh.MF} <-$ \text{basicProfile} (\text{singh01EntrezIDs}[1:100], \text{onto}=\text{"MF"}, \text{level}=2, \text{orgPackage}=\text{"org.Hs.eg.db"})$ $$ \text{plotProfiles}(\text{welsh.MF},\text{`Functional profiles} \text{ for Welsh dataset',percentage}=\text{TRUE})$ $$ \text{welsh.singh.MF} <-$ \text{mergeProfilesLists}(\text{welsh.MF}, \text{singh.MF}, \text{profNames}=c(\text{"Welsh"},\text{"Singh"}))$ $$ \text{plotProfiles}(\text{welsh.singh.MF}, \text{percentage}=\text{TRUE}, \text{multiplePlots}=\text{TRUE}, \text{labelWidth}=30)$ $$
```

printProfiles Print functional profiles

Description

Prints basic functional profiles created with the 'basicProfile' instruction. Allows for several formatting operations such as truncating long labels, removing empty categories or choosing between absolute or relative frequencies. If several profiles have to be printed together they must be first merged using the 'mergeProfiles' function.

Usage

```
\label{eq:printProfiles} printProfiles (a Prof, a Title = "Functional Profile", an Onto = NULL, percentage = FALSE, \\ Width=25, emptyCats=FALSE)
```

30 prostateIds

Arguments

aProf Functional profile to plot aTitle Title for the figures

anOnto Ontology (to appear in the title)

percentage Plot absolute or relative frequencies (not summing to 100)
Width Maximum width for the description of GO categories

emptyCats Set to 'TRUE' if empty categories should appear in the profile

Value

The printout

Examples

```
\label{lem:controller} $$ \text{data}(\text{prostateIds})$ $$ \text{data}(\text{prostateIds})$ $$ \text{welsh.MF} <- \text{basicProfile} (\text{welsh01EntrezIDs}[1:100], \text{onto}="\text{MF"}, \text{level}=2, \text{orgPackage}="\text{org.Hs.eg.db"})$ $$ \text{singh.MF} <- \text{basicProfile} (\text{singh01EntrezIDs}[1:100], \text{onto}="\text{MF"}, \text{level}=2, \text{orgPackage}="\text{org.Hs.eg.db"})$ $$ \text{printProfiles}(\text{welsh.MF}, \text{Functional profiles} \text{ for Welsh dataset',percentage}=TRUE, \text{ anOnto}='\text{MF'})$ $$ \text{welsh.singh.MF} <- \text{mergeProfilesLists}(\text{welsh.MF}, \text{ singh.MF}, \text{ profNames}=c("Welsh", "Singh"))$ $$ \text{printProfiles}(\text{welsh.singh.MF}, \text{ percentage}=TRUE, \text{ emptyCats}=TRUE)$ $$
```

prostateIds

Prostate cancer-related genes

Description

Entrez identifiers for genes related with Prostate Cancer selected from two datasets analyzed by Welsh et al. (2001) and Singh et al. (2002) respectively. The genes have been selected from freely available datasets in the internet using a standard workflow for selecting differentially expressed genes. The dataset contains 4 character vectors, each corresponding to the entrez identifiers of the genes selected at a 5% and 1% significance level from the Welsh and Singh dataset respectively.

welsh05EntrezIDs List of genes selected from Welsh et al. study at a 0.05 significance level. welsh01EntrezIDs List of genes selected from Welsh et al. study at a 0.01 significance level. singh05EntrezIDs List of genes selected from Singh et al. study at a 0.05 significance level. singh01EntrezIDs List of genes selected from Singh et al. study at a 0.01 significance level.

Usage

data(prostateIds)

Format

Each dataset is a character vector with a different number of elements which (should) correspond to valid Entrez identifiers

prostateIds 31
