1 Introduction

Chromatin immunoprecipitation (ChIP) followed by high-throughput tag sequencing (ChIP-seq) and ChIP followed by genome tiling array analysis (ChIP-chip) become more and more prevalent high throughput technologies for identifying the binding sites of DNA-binding proteins in a genome-wide bases. A number of algorithms have been published to facilitate the identification of the binding sites of the DNA-binding proteins of interest. The identified binding sites in the list of peaks are usually converted to BED or WIG file format to be loaded to UCSC genome browser as custom tracks for investigators to view the proximity to various

^{*}julie.zhu@umassmed.edu

genomic features such as genes, exons and conserved elements. However, clicking through the genome browser could be a daunting task for the biologist if the number of peaks gets large or the peaks spread widely across the genome. Here we have developed a Bioconducor package called ChIPpeakAnno to facilitate the batch annotation of the peaks identified from either ChIP-seq or ChIP-chip experiments. We have implemented functionality to find the nearest gene, exon, miRNA, gene end or custom features supplied by users such as most conserved elements and other transcription factor binding sites leveraging IRanges. Since the genome annotation gets updated from time to time, we have leveraged the biomaRt package from Bioconductor to retrieve the annotation data on the fly if the annotation of interest is available via the biomaRt package. The users also have the flexibility to pass their own annotation data as RangedData or pass in annotation data from GenomicFeatures. We have also leveraged BSqenome and biomaRt package on implementing functions to retrieve the sequences around the peak identified for peak validation. To understand whether the identified peaks are enriched around genes with certain GO terms, we have implemented GO enrichment test in ChIPpeakAnno package leveraging the hypergeometric test phyper in stats package and integrated with Gene Ontology (GO) annotation from GO.db package and multiplicity adjustment functions from *multtest* package.

2 Examples of using ChIPpeakAnno

2.1 Task 1: Find the nearest feature such as gene and the distance to the feature such as the transcription start site (TSS) of the nearest gene

We have a list of peaks identified from ChIP-seq or ChIP-chip experiments and we would like to retrieve the nearest gene and distance to the corresponding gene transcription start site. We have retrieved all the genomic locations of the genes for human genome as TSS.human.NCBI36 data package for repeated use with function getAnnotation, now we just pass the annotation to the annotatePeakInBatch function.

```
> library(ChIPpeakAnno)
> data(myPeakList)
> data(TSS.human.NCBI36)
> annotatedPeak = annotatePeakInBatch(myPeakList[1:6,], AnnotationData=TSS.human.NCBI36)
> as.data.frame(annotatedPeak)
                                                   names
                                                                 peak strand

To annotate the peaks with other genomic feature, you will need to call function getAnnotation with featureType, e.g., "Exon" for finding the nearest exon, and "miRNA" for finding the nearest miRNA, "5utr" or '3utr"for finding the overlapping 5 prime UTR or 3 prime UTR. Please refer to getAnnotation function for more details.

We have presented the examples using human genome as annotation source. To annotate your data with other species, you will need to pass to the function getAnnotation the appropriate dataset for example, drerio_gene_ensembl for zebrafish genome, mmusculus_gene_ensembl for mouse genome and rnorvegicus_gene_ensembl for rat genome. For a list of available biomart and dataset, please refer to the biomaRt package documentation (Durinck S. et al., 2005). For fast access, in addition to TSS.human.NCBI36, TSS.human.GRCh37, TSS.mouse.NCBIM37, TSS.mouse.GRCm38, TSS.rat.RGSC3.4, TSS.rat.Rnor_5.0, TSS.zebrafish.Zv8, and TSS.zebrafish.Zv9 are included as annotation data packages.

You could also pass your own annotation data into the function annotatePeakInBatch. For example, if you have a list of transcription factor biding sites from literature and are interested in obtaining the nearest binding site of the transcription factor and distance to it for the list of peaks.

Both BED format and GFF format are common file format that provides a flexible way to define the peaks and annotations as the data lines. Therefore, conversion functions BED2RangedData and GFF2RangedData were implemented for converting these data format to RangedData before calling annotatePeakInBatch

Once you annotated the peak list, you can plot the distance to nearest feature such as TSS.

2.2 Task 2: Obtain overlapping peaks for potential transcription factor complex and determine the significance of the overlapping and generate Venn Diagram

Here is an example of obtaining overlapping peaks with maximum gap 1kb for two peak ranges.

Here is a list of overlapping peaks with maximum gap 1kb and a pie graph describing the distribution of relative position of peaks1 to peaks2 for overlapping peaks.

```

2.3 Task 3: Obtain sequences surrounding the peaks for PCR validation or motif discovery

Here is an example of obtaining sequences surrounding the peak intervals including 20 bp upstream and downstream sequence.

You can easily convert the obtained sequences into fasta format for motif discovery by calling the function write2FASTA.

```
> write2FASTA(peaksWithSequences, "test.fa")
```

2.4 Task 4: Obtain enriched gene ontology (GO) terms near the peaks

Once you have obtained the annotated peak data from the example above, you can also use the function getEnrichedGO to obtain a list of enriched gene ontology (GO) terms using hypergeometric test.

```
library(org.Hs.eg.db) 
 enrichedGO = getEnrichedGO (annotatedPeak, orgAnn = "org.Hs.eg.db", maxP = 0.01, multiAdj = TRUE, minGOterm = 10, multiAdjMethod = "BH")
```

Please note that org.Hs.eg.db is the GO gene mapping for Human, for other organisms, please refer to http://www.bioconductor.org/packages/release/data/annotation/ for additional org.xx.eg.db packages.

```
> data(enrichedGO)
```

> c(annotatedBDP\$percentPeaksWithBDP, annotatedBDP\$n.peaks, annotatedBDP\$n.peaksWithBDP)

^{[1] 0.3 10.0 3.0}

2.6 Task 6: Output a summary of motif occurrence in the peaks.

Here is an example to search the peaks for the motifs in example pattern.fa file.

2.7 Task 7: Add other IDs to annotated peaks or enrichedGO

Here is an example to add gene symbol to annotated peaks.

```
> data(annotatedPeak)
> library(org.Hs.eg.db)
> addGeneIDs(annotatedPeak[1:6,],"org.Hs.eg.db",c("symbol"))
Adding symbol ... done
prepare output ... done
