ICMg.combined.sampler

ICMg.combined.sampler

Description

Main function of the ICMg algorithm. ICMg.combined.sampler computes samples from the posterior of the assignments of datapoints (interactions and expression profiles) to latent components. From these we can then obtain component membership distributions and clusterings for genes.

Usage

 $\label{local_combined_sampler} \mbox{LCMg.combined.sampler(L, X, C, alpha=10, beta=0.01, pm0=0, V0=1, V=0.1, B.num=8, Combined_sampler(L, X, C, alpha=10, beta=0.01, pm0=0, V0=1, V=0.1, B.num=8, Combined_sampler(L, X, C, alpha=10, beta=0.01, pm0=0, V0=1, V=0.1, B.num=8, Combined_sampler(L, X, C, alpha=10, beta=0.01, pm0=0, V0=1, V=0.1, B.num=8, Combined_sampler(L, X, C, alpha=10, beta=0.01, pm0=0, V0=1, V=0.1, B.num=8, Combined_sampler(L, X, C, alpha=10, beta=0.01, pm0=0, V0=1, V=0.1, B.num=8, Combined_sampler(L, X, C, alpha=10, beta=0.01, pm0=0, V0=1, V=0.1, B.num=8, Combined_sampler(L, X, C, alpha=10, beta=0.01, pm0=0, V0=1, V=0.1, B.num=8, Combined_sampler(L, X, C, alpha=10, beta=0.01, beta$

Arguments

L	N x 2 matrix of link endpoints ($N = number of links$).
X	$M \times D$ matrix of gene expression profiles ($M =$ number of nodes, $D =$ number of observations).
С	Number of components.
alpha	Hyperparameter describing the global distribution over components, larger alpha gives a more uniform distribution.
beta	Hyperparameter describing the component-wise distributions over nodes, larger beta gives a more uniform distribution.
pm0	Hyperparameter describing the prior mean of the expression profiles, should be zero.
V0	Hyperparameter describing the variation of the component-wise expression profiles means around pm0.
V	Hyperparameter describing the variation of gene-specific expression profiles around the component-wise means.
B.num	Number of burnin rounds.*
B.size	Size of one burnin round.*
S.num	Number of sample rounds.*
S.size	Size of one sample round.*
C.boost	Set to 1 to use faster iteration with C, set to 0 to use slower R functions.

Details

One run consists of two parts, during burnin the sampler is expected to mix, after which the samples are taken. Information about convergence (convN and convL are estimates of convergence for link and node sampling, respectively) and component sizes are printed after each burnin/sample round. For example: B.num=8, B.size=100, S.num=20, S.size=10, runs 800 burnin iterations in 8 rounds and then takes 20 samples with an interval of 10 iterations.

Value

Returns samples as a list:

Z	S.num x N matrix of samples of component assignments for links.	
W	S.num x M matrix of samples of component assignments for gene expression profiles.	
convl	Vector of length (B.num $+$ S.num) with convergence estimator values for link sampling.	
convn	Vector of length (B.num + S.num) with convergence estimator values for node sampling.	
countsl	(B.num + S.num) x C matrix of link component sizes.	
countsn	(B.num + S.num) x C matrix of node component sizes.	

additionally all parameters of the run are included in the list.

Description

Function for computing the component memberships for each data point from the MCMC samples.

Usage

```
ICMg.get.comp.memberships(links, samples)
```

Arguments

links N x 2 matrix of link endpoints (N = number of links).

samples Posterior samples, as given by either ICMg.combined.sampler or ICMg.links.sampler.

Value

A matrix containing the component memberships for each data point (node).

NetResponseModel-class

Class "NetResponseModel"

Description

A NetResponse model.

Objects from the Class

Returned by detect.responses function.

Slots

moves Subnetwork merging history.

last.grouping Subnetworks in the last agglomeration level: feature indices

subnets Subnetworks in the last agglomeration level: feature names

params Input parameters.

datamatrix Original input datamatrix that was used to learn the model.

network Original network that was used to learn the model (after netresponse preprocessing), given in graphNEL format.

models Parameters for the learned subnetwork models.

Methods

```
[[ signature(x = "NetResponseModel"):...
show signature(x = "NetResponseModel"):...
get.dat signature(x = "NetResponseModel"):...
```

Author(s)

```
Leo Lahti < leo.lahti@iki.fi>
```

```
showClass("NetResponseModel")
```

6 detect.responses

add.ellipse Add ellipse to an existing plot.
--

Description

Calculates and plots ellipse corresponding to specified confidence interval in 2-dimensional plot.

Usage

```
add.ellipse(centroid, covmat, confidence = 0.95, npoints = 100, col = "black", .
```

Arguments

centroid	Vector with two elements defining the ellipse centroid.	
covmat	Covariance matrix for the investigated data. Only diagonal covariances supported.	
confidence	Confidence level determining the ellipse borders based on the covariance matrix.	
npoints	Number of plotting points.	
col	Color.	
	Other arguments to be passed.	

Value

Used for plotting side effects.

Author(s)

```
Leo Lahti < leo.lahti@iki.fi>
```

Examples

```
\#add.ellipse(centroid = c(0, 0), covmat = diag(c(1,2)))
```

```
detect.responses detect.responses
```

Description

Main function of the NetResponse algorithm. Detecting network responses across the conditions.

Usage

```
detect.responses(datamatrix, network, initial.responses = 1,
    max.responses = 10, max.subnet.size = 10, verbose =
    TRUE, prior.alpha = 1, prior.alphaKsi = 0.01, prior.betaKsi =
    0.01, update.hyperparams = 0, implicit.noise = 0, vdp.threshold =
    1.0e-5, merging.threshold = 0, ite = Inf,
    information.criterion = "AIC", speedup = TRUE,
    speedup.max.edges = 10, mc.cores = 1, ...)
```

detect.responses 7

Arguments

datamatrix Matrix of samples x features. For example, gene expression matrix with condi-

tions on the rows, and genes on the columns. The matrix contains same features than the 'network' object, characterizing the network states across the different

samples.

network Network describing undirected pairwise interactions between features of 'data-

matrix'. The following formats are supported: binary matrix, graphNEL, igraph,

graphAM, Matrix, dgCMatrix, dgeMatrix

initial.responses

Initial number of components for each subnetwork model. Used to initialize calculations.

max.responses

Maximum number of responses for each subnetwork. Can be used to limit the potential number of network states.

max.subnet.size

Numeric. Maximum allowed subnetwork size.

verbose Logical. Verbose parameter.

implicit.noise

Implicit noise parameter. Add implicit noise to vdp mixture model. Can help to avoid overfitting to local optima, if this appears to be a problem.

update.hyperparams

Logical. Indicate whether to update hyperparameters during modeling.

prior.alpha, prior.alphaKsi, prior.betaKsi

Prior parameters for Gaussian mixture model that is calculated for each subnetwork (normal-inverse-Gamma prior). alpha tunes the mean; alphaKsi and betaKsi are the shape and scale parameters of the inverse Gamma function, respectively.

vdp.threshold

Minimal free energy improvement after which the variational Gaussian mixture algorithm is deemed converged.

merging.threshold

Minimal cost value improvement required for merging two subnetworks.

Defines maximum number of iterations on posterior update (updatePosterior).

Increasing this can potentially lead to more accurate results, but computation may take longer.

information.criterion

Information criterion for model selection. Default is BIC (Bayesian Information Criterion); other options include AIC and AICc.

Takes advantage of approximations to PCA, mutual information etc in various places to speed up calculations. Particularly useful with large and densely connected networks and/or large sample size.

speedup.max.edges

Used if speedup = TRUE. Applies prefiltering of edges for calculating new joint models between subnetwork pairs when potential cost changes (delta) are updated for a newly merged subnetwork and its neighborghs. Empirical mutual information between each such subnetwork pair is calculated based on their first principal components, and joint models will be calculated only for the top candidates up to the number specified by speedup.max.edges. It is expected that the subnetwork pair that will benefit most from joint modeling will be among the top mutual infomation candidates. This way it is possible to avoid calculating exhaustive many models on the network hubs.

8 dna

```
mc.cores Number of cores to be used in parallelization. See help(mclapply) for details.
... Further optional arguments to be passed.
```

Value

NetResponseModel object.

Author(s)

Leo Lahti, Olli-Pekka Huovilainen and Antonio Gusmao. Maintainer: Leo Lahti < leo .lahti@iki.fi>

References

Leo Lahti et al.: Global modeling of transcriptional responses in interaction networks. Bioinformatics (2010). See citation("netresponse") for details.

Examples

```
library(netresponse)
data( toydata )  # Load toy data set
D  <- toydata$emat  # Response matrix (for example, gene expression)
netw <- toydata$netw  # Network

# Run NetReponse algorithm
model <- detect.responses(D, netw, verbose = FALSE)</pre>
```

dna

Dna damage data set (PPI and expression)

Description

A combined yeast data set with protein-protein interactions and gene expression (dna damage). Gene expression profiles are transformed into links by computing a Pearson correlation for all pairs of genes and treating all correlations above 0.85 as additional links.

Usage

```
data(dna)
```

Format

List of following objects:

```
ppi PPI data matrix
exp gene expression profiles data matrix
gids Vector of gene ids corresponding to indices used in data matrices
obs Gene expression observation details
combined.links pooled matrix of PPI and expression links
```

find.similar.features 9

Details

Number of genes: 1823, number of interactions: 12382, number of gene expression observations: 52, number of total links with PPI and expression links: 15547.

Source

PPI data pooled from yeast data sets of [1] and [2]. Dna damage expression set of [3].

Examples

data(dna)

find.similar.features

Find similar features with a given subnetwork.

Description

Given subnetwork, orders the remaining features (genes) in the input data based on similarity with the subnetwork. Allows the identification of similar features that are not directly connected in the input network.

Usage

find.similar.features(model, subnet.id, datamatrix = NULL, verbose = FALSE, info

Arguments

model NetResponseModel object.
subnet.id Investigated subnetwork.

datamatrix Optional. Can be used to compare subnetwork similarity with new data which

was not used for learning the subnetworks.

verbose Logical indicating whether progress of the algorithm should be indicated on the

screen.

information.criterion

Information criterion for model selection. By default uses the same than in the 'model' object.

10 get.dat

Details

The same similarity measure is used as when agglomerating the subnetworks: the features are ordered by delta (change) in the cost function, assuming that the feature would be merged in the subnetwork. The smaller the change, the more similar the feature is (change would minimize the new cost function value). Negative values of delta mean that the cost function would be improved by merging the new feature in the subnetwork, indicating features having coordinated response.

Value

A data frame with elements feature.names (e.g. gene IDs) and delta, which indicates similarity level. See details for details. The smaller, the more similar. The data frame is ordered such that the features are listed by decreasing similarity.

Author(s)

```
Leo Lahti < leo.lahti@iki.fi>
```

References

See citation("netresponse") for reference details.

Examples

```
data(toydata)
model <- toydata$model
subnet.id <- "Subnet-1"
g <- find.similar.features(model, subnet.id)
# List features that are similar to this subnetwork (delta < 0)
# (ordered by decreasing similarity)
subset(g, delta < 0)</pre>
```

get.dat

get.dat

Description

Retrieve data for a given subnetwork.

Usage

```
get.dat(model, subnet.id, sample = NULL)
```

Arguments

model Result from NetResponse (detect.responses function).

subnet.id Subnet identifier. A natural number which specifies one of the subnetworks within the 'model' object.

sample Specify samples for which the data will be retrieved.

Value

Data matrix features x samples.

get.model.parameters 11

Author(s)

```
Leo Lahti < leo.lahti@iki.fi>
```

References

See citation("netresponse")

Examples

Description

Retrieve the mixture model parameters of the NetResponse algorithm for a given subnetwork.

Usage

```
get.model.parameters(model, subnet.id)
```

Arguments

model Result from NetResponse (detect.responses function).

subnet.id Subnet identifier. A natural number which specifies one of the subnetworks

within the 'model' object.

Details

Only the non-empty components are returned. Note: the original data matrix needs to be provided for function call separately.

Value

A list with the following elements:

mu	Centroids for the mixture components. Components x nodes.	
sd	Standard deviations for the mixture components. A vector over the nodes for each component, implying the diagonal covariance matrix of the model (i.e. diag(std^2)). Components x nodes	
W	Vector of component weights.	
nodes	List of nodes in the subnetwork.	
K	Number of mixture components.	

12 get.subnets

Author(s)

```
Leo Lahti < leo.lahti@iki.fi>
```

References

Leo Lahti et al.: Global modeling of transcriptional responses in interaction networks. Bioinformatics (2010). See citation("netresponse") for details.

Examples

get.subnets

get.subnets

Description

List the detected subnetworks (each is a list of nodes in the corresponding subnetwork).

Usage

```
get.subnets(model, get.names = TRUE, min.size = 2, max.size = Inf, min.responses
```

Arguments

model
Output from the detect.responses function. An object of NetResponseModel class.

get.names
Logical. Indicate whether to return subnetwork nodes using node names (TRUE) or node indices (FALSE).

min.size, max.size
Numeric. Filter out subnetworks whose size is not within the limits specified here.

min.responses

Numeric. Filter out subnetworks with less responses (mixture components) than specified here.

Value

A list of subnetworks.

Author(s)

```
Leo Lahti < leo.lahti@iki.fi>
```

References

Leo Lahti et al.: Global modeling of transcriptional responses in interaction networks. Bioinformatics (2010). See citation("netresponse") for details.

Examples

```
library(netresponse)

# Load a pre-calculated netresponse model obtained with
# model <- detect.responses(toydata$emat, toydata$netw, verbose = FALSE)
data( toydata )
model <- toydata$model

#List the detected subnetworks
# (each is a list of nodes for the given subnetwork):
get.subnets(model)</pre>
```

```
list.significant.responses
```

List responses with significant associations to a given sample group.

Description

List responses with significant associations to a given sample group.

Usage

```
list.significant.responses(model, sample, qth = 1, method = "hypergeometric")
```

Arguments

model NetResponseModel object.

sample User-specified samples group for which the enrichments are calculated. For

instance, an annotation category.

qth q-value threshold for enrichments

method Enrichment method.

Value

Table containing statistics of the significantly associated responses.

Author(s)

```
Leo Lahti < leo.lahti@iki.fi>
```

References

See citation("netresponse")

14 model.stats

See Also

response.enrichment

Examples

#

model.stats

model.stats

Description

Subnetwork statistics: size and number of distinct responses for each subnet.

Usage

```
model.stats( model )
```

Arguments

model

Result from NetResponse (detect.responses function).

Value

A 'subnetworks x properties' data frame containing the following elements.

Vector giving the number of responses in each subnetwork.

Author(s)

Leo Lahti <leo.lahti@iki.fi>

References

Leo Lahti et al.: Global modeling of transcriptional responses in interaction networks. Bioinformatics (2010). See citation("netresponse") for reference details.

```

subnet.id <- names(model@subnets)[[1]]
m <- get.model.parameters(model, subnet.id)
print(m)</pre>
```

order.responses

order.responses

Description

Orders the responses by association strength (enrichment score) to a given sample set. For instance, if the samples correspond to a particular experimental factor, this function can be used to prioritize the responses according to their association strength to this factor.

Usage

```
order.responses(model, sample, method = "hypergeometric", min.size = 2,
max.size = Inf, min.responses = 2, subnet.ids = NULL, verbose = FALSE)
```

Arguments

model	NetResponseModel object.
sample	Measure enrichment of this sample (set) across the observed responses.
method	'hypergeometric' measures enrichment of factor levels in this response; 'precision' measures response purity for each factor level; 'dependency' measures logarithm of the joint density between response and factor level vs. their marginal densities: $\log(P(r,s)/(P(r)P(s)))$
min.size, max.size, min.responses	
	Optional parameters to filter the results based on subnet size and number of responses.,
subnet.ids	Specify subnets for which the responses shall be ordered. By default, use all subnets.,
verbose	Follow progress by intermediate messages.

Value

A data frame with elements 'ordered.responses' which gives a data frame of responses ordered by enrichment score for the investigated sample. The subnetwork, response id and enrichment score are shown. The method field indicates the enrichment calculation method. The sample field lists the samples et for which the enrichments were calculated. The info field lists additional information on enrichment statistics.

osmo 17

Note

Tools for analyzing end results of the model.

Author(s)

```
Leo Lahti < leo.lahti@iki.fi>
```

References

See citation("netresponse") for citation details.

Examples

```
# - for given sample/s (factor level), order responses (across all subnets) by association
#order.responses(model, sample, method = "hypergeometric") # overrepresentation
```

osmo

Osmoshock data set (PPI and expression)

Description

A combined yeast data set with protein-protein interactions and gene expression (osmotick shock response). Gene expression profiles are transformed into links by computing a Pearson correlation for all pairs of genes and treating all correlations above 0.85 as additional links.

Usage

```
data(osmo)
```

Format

List of following objects:

```
ppi PPI data matrix
```

exp gene expression profiles data matrix

gids Vector of gene ids corresponding to indices used in data matrices

obs Gene expression observation details

combined.links pooled matrix of PPI and expression links

Details

Number of genes: 1711, number of interactions: 10250, number of gene expression observations: 133, number of total links with PPI and expression links: 14256.

Source

PPI data pooled from yeast data sets of [1] and [2]. Dna damage expression set of [3].

Examples

```
data(osmo)
```

plot.associations Association strength between category labels and responses.

Description

Plot association strength between user-defined category labels and responses in a selected subnetwork.

Usage

```
plot.associations(x, subnet.id, labels, method = "hypergeometric", mode = "group")
```

Arguments

X	NetResponseModel object
subnet.id	Subnetwork.
labels	Factor. Labels for the data samples. Name by samples, or provide in the same order as in the original data.
method	Method to calculate association strength.
mode	group.by.responses or group.by.classes: indicate barplot grouping type.
	Other arguments to be passed for plot.

Details

Associations are shown in terms -log10(p) enrichment values for the annotation categories for the responses within the specified subnetwork. No correction for multiple testing.

Value

Used for side effect (plotting).

Author(s)

```
Leo Lahti < leo.lahti@iki.fi>
```

References

See citation("netresponse").

plot.pca 19

See Also

plot.responses

Examples

#

ŧ

plot.pca plot.pca

Description

Visualize data, centroids and response confidence intervals for a given subnetwork with PCA. Optionally, color the samples according to annotations labels.

Usage

```
plot.pca(x, subnet.id, labels = NULL, confidence = 0.95, ...)
```

Arguments

X	NetResponseModel object. Output from the detect.responses function.	
subnet.id	Subnetwork id. Either character as 'Subnetwork-2' or numeric as 2, which is then converted to character.	
labels	Optional: sample class labels to be indicated in colors.	
confidence	Confidence interval for the responses based on the covariances of each response. If NULL, no plotting.	

... Further arguments for plot function.

Value

Used for its side-effects.

Author(s)

```
Leo Lahti < leo.lahti@iki.fi>
```

References

See citation("netresponse") for citation details.

```
#plot.pca(x, subnet.id)
```

20 response.enrichment

read.network

Reading network files

Description

Function to read network files.

Usage

```
read.sif(sif.file, format = "graphNEL", directed = FALSE, header = TRUE, sep = "
```

Arguments

sif.file	Name of network file in SIF format.
format	Output format: igraph or graphNEL
directed	Logical. Directed/undirected graph. Not used in the current model.
header	Logical. Indicate whether the SIF file has header or not.
sep	Field separator.
	Further optional arguments to be passed for file reading.

Details

Read in SIF network file, return R graph object in igraph or graphNEL format.

Value

R graph object in igraph or graphNEL format.

Author(s)

```
Leo Lahti < leo.lahti@iki.fi>
```

Examples

```
#net <- read.sif("network.sif")</pre>
```

```
response.enrichment
```

Enrichment for a specified sample group in the given response.

Description

Calculate enrichment values for a specified sample group in the given response.

Usage

```
response.enrichment(subnet.id, model, s, response, method = "hypergeometric")
```

response2sample 21

Arguments

subnet.id Subnet.

 $\verb| model| \\ Net Response Model| object.$

s User-defined sample group. For instance, samples belonging to a particular an-

notation class.

response Response id (integer) within the subnet.

method Enrichment method.

Value

List with enrichment statistics, depending on enrichment method.

Author(s)

```
Leo Lahti < leo.lahti@iki.fi>
```

References

See citation("netresponse").

See Also

order.responses

Examples

#

response2sample

response2sample

Description

List the most strongly associated response of a given subnetwork for each sample.

Usage

```
response2sample(model, subnet.id, component.list = TRUE, verbose
= FALSE)
```

Arguments

model A NetResponseModel object. Result from NetResponse (detect.responses func-

tion).

subnet.id Subnet id. A natural number which specifies one of the subnetworks within the

'model' object.

component.list

List samples separately for each mixture component (TRUE). Else list the most

strongly associated component for each sample (FALSE).

verbose Follow progress by intermediate messages.

22 sample2response

Value

A list. Each element corresponds to one subnetwork response, and contains a list of samples that are associated with the response (samples for which this response has the highest probability P(response | sample)).

Author(s)

Examples

sample2response sample2response

Description

Probabilistic sample-response assignments for given subnet.

Usage

```
sample2response(model, subnet.id)
```

Arguments

model Result from NetResponse (detect.responses function).

subnet.id Subnet identifier. A natural number which specifies one of the subnetworks within the 'model' object.

Value

A matrix of probabilities. Sample-response assignments for given subnet, listing the probability of each response, given a sample.

toydata 23

Author(s)

```
Leo Lahti < leo.lahti@iki.fi>
```

References

Leo Lahti et al.: Global modeling of transcriptional responses in interaction networks. Bioinformatics (2010). See citation("netresponse") for citation details.

Examples

```
#library(netresponse)
#data( toydata )  # Load toy data set
#D <- toydata$emat  # Response matrix (for example, gene expression)
#netw <- toydata$netw  # Network

# Detect network responses
#model <- detect.responses(D, netw, verbose = FALSE)

# Assign samples to responses (soft, probabilistic assignments sum to 1)
#response.probabilities <- sample2response(model, subnet.id = "Subnet-1")</pre>
```

toydata

toydata

Description

Toy data for NetResponse examples.

Usage

```
data (toydata)
```

Format

Toy data: a list with three elements:

emat: Data matrix (samples x features). This contains the same features that are provided in the network (toydata\$netw). The matrix characterizes measurements of network states across different conditions.

netw: Binary matrix that describes pairwise interactions between features. This defines an undirected network over the features. A link between two nodes is denoted by 1.

model: A pre-calculated model. Object of NetResponseModel class, resulting from applying the netresponse algorithm on the toydata with model <- detect.responses(D, netw).

24 vdp.mixt

Examples

vdp.mixt

vdp.mixt

Description

Accelerated variational Dirichlet process Gaussian mixture.

estimation.

Usage

```
vdp.mixt(dat, prior.alpha = 1, prior.alphaKsi = 0.01, prior.betaKsi =
0.01, do.sort = TRUE, threshold = 1e-05, initial.K = 1, ite = Inf,
implicit.noise = 0, c.max = 10, speedup = TRUE, min.size = 5)
```

Arguments

dat prior.alpha,	Data matrix (samples x features). prior.alphaKsi, prior.betaKsi Prior parameters for Gaussian mixture model (normal-inverse-Gamma prior). alpha tunes the mean; alphaKsi and betaKsi are the shape and scale parameters of the inverse Gamma function, respectively.	
do.sort	When true, qOFz will be sorted in decreasing fashion by component size, based on colSums(qOFz). The qOFz matrix describes the sample-component assigments in the mixture model.	
threshold	Defines the minimal free energy improvement that stops the algorithm: used to define convergence limit.	
initial.K	Initial number of mixture components.	
ite	Defines maximum number of iterations on posterior update (updatePosterior). Increasing this can potentially lead to more accurate results, but computation may take longer.	
implicit.noise		
	Adds implicit noise; used by vdp.mk.log.lambda.so and vdp.mk.hp.posterior.so. By adding noise (positive values), one can avoid overfitting to local optima in some cases, if this happens to be a problem.	
c.max	Maximum number of candidates to consider in find.best.splitting. During mixture model calculations new mixture components can be created until this upper limit has been reached. Defines the level of truncation for a truncated stickbreaking process.	
speedup	When learning the number of components, each component is splitted based on its first PCA component. To speed up, approximate by using only subset of data to calculate PCA.	
min.size	Minimum size for a component required for potential splitting during mixture	

vdp.mixt 25

Details

Implementation of the Accelerated variational Dirichlet process Gaussian mixture model algorithm by Kenichi Kurihara et al., 2007.

Value

prior Prior parameters of the vdp-gm model.

posterior Posterior estimates for the model parameters and statistics.

weights: Mixture proportions, or weights, for the Gaussian mixture components.

centroids: Centroids of the mixture components.

sds: Standard deviations for the mixture model components (posterior modes of the covariance diagonals square root). Calculated as sqrt(invgam.scale/(invgam.shape

+1)).

qOFz: Sample-to-cluster assignments (soft probabilistic associations).

Nc: Component sizes

invgam.shape: Shape parameter (alpha) of the inverse Gamma distribution invgam.scale: Scale parameter (beta) of the inverse Gamma distribution

Nparams: Number of model parameters

K: Number of components in the mixture model

opts Model parameters that were used.

free.energy

Free energy of the model.

Note

```
# Centroids of the detected Gaussian components
mixt$posterior$centroids
```

Hard mixture component assignments for the samples
apply(mixt\$posterior\$qOFz, 1, which.max)

```
write.netresponse.results
```

Write NetResponse results summary into a file.

Description

Write NetResponse results summary into a file.

Usage

```
write.netresponse.results(x, subnet.ids = NULL, filename)
```

Arguments

x NetResponseModel

subnet.ids List of subnet ids to consider. By default, all subnets.

filename Output file name.

Details

Experimental version.

Value

Used for side effects.
