## 1 Introduction

You may have found yourself in a familiar predicament for many bioinformaticians: you have a lot of sequences and you need to *downsize* before you can get going. You may also *theorize* that this must be an easy problem to solve —given sequences, output clusters. But what can you *utilize* to solve this problem? This vignette will familiarize you with the `Clusterize` function in the `DECIPHER` package. `Clusterize` will revolutionize all your clustering needs! Why `Clusterize`?

- Scalability - `Clusterize` will *linearize* the search space so that many sequences can be clustered in a reasonable amount of time.
- Simplicity - Although you can *individualize* `Clusterize`, the defaults are straightforward and should meet most of your needs.
- Accuracy - `Clusterize` will *maximize* your ability to extract biologically meaningful results from your sequences.

This vignette will summarize the use of `Clusterize` to cluster DNA, RNA, or protein sequences.

## 2 Getting Started

To get started we need to load the `DECIPHER` package, which automatically *mobilize* a few other required packages.

```
> library(DECIPHER)
```

There's no need to memorize the inputs to Clusterize, because its help page can be accessed through:

```
> ? Clusterize
```

### 3 Optimize your inputs to Clusterize

Clusterize requires that you first digitize your sequences by loading them into memory. For the purpose of this vignette, we will capitalize on the fact that DECIPHER already includes some built-in sets of sequences.

```
> # specify the path to your file of sequences:  
> fas <- "<<path to training FASTA file>>"  
> # OR use the example DNA sequences:  
> fas <- system.file("extdata",  
+ "50S_ribosomal_protein_L2.fas",  
+ package="DECIPHER")  
> # read the sequences into memory  
> dna <- readDNAStringSet(fas)  
> dna  
DNAStringSet object of length 317:  
  width seq names  
[1] 819 ATGGCTTTAAAAATTAAATC...ATTTATTGTAAAAAGAAAA Rickettsia prowaz...

[317] 840 ATGGGCATTGCAAATATCGAC...CAAGACGGCTTCGGCGAGGT Gloeobacter viola...
```

The Clusterize algorithm will generalize to nucleotide or protein sequences, so we must choose which we are going to use. Here, we hypothesize that weaker similarities can be detected between proteins and, therefore, decide to use the translated coding (amino acid) sequences. If you wish to cluster at high similarity, you could also strategize that nucleotide sequences would be better because there would be more nucleotide than amino acid differences.

```
> aa <- translate(dna)  
> aa  
AAStringSet object of length 317:  
  width seq names  
[1] 273 MALKNFNPITPSLRELVQVDKT...STKGKKTRKNKRTSKFIVKKRK Rickettsia prowaz...

```

```
> seqs <- aa # could also cluster the nucleotides
```

Now you can choose how to parameterize the function, with the main arguments being *myXStringSet* and *cutoff*. In this case, we will initialize *cutoff* at `seq(0.5, 0, -0.1)` to cluster sequences from 50% to 100% similarity by 10%’s. It is important to recognize that *cutoffs* can be provided in *ascending* or *descending* order and, when *descending*, groups at each *cutoff* will be nested within the previous *cutoff*’s groups.

We must also choose whether to customize the calculation of distance. The defaults will penalize gaps as single events, such that each consecutive set of gaps (i.e., insertion or deletion) is considered equivalent to one mismatch. If you want to standardize the definition of distance to be the same as most other clustering programs then set: *penalizeGapLetterMatches* to TRUE (i.e., every gap position is a mismatch), *method* to "shortest", *minCoverage* to 0, and *includeTerminalGaps* to TRUE. It is possible to rationalize many different measures of distance – see the *DistanceMatrix* function for more information about alternative parameterizations.

We can further personalize the inputs as desired. The main function argument to emphasize is *processors*, which controls whether the function is parallelized on multiple computer threads (if **DECIPHER** was built with OpenMP enabled). Setting *processors* to a value greater than 1 will speed up clustering considerably, especially for large size clustering problems. Once we are ready, it’s time to run *Clusterize* and wait for the output to materialize!

```
> clusters <- Clusterize(seqs, cutoff=seq(0.5, 0, -0.1), processors=1)
```

Partitioning sequences by 6-mer similarity:

```
iteration 8 of up to 400 (100.0% coverage)
```

```
Time difference of 0.04 secs
```

Sorting by relatedness within 1 group:

```
iteration 51 of up to 51 (100.0% stability)
```

```
Time difference of 1.15 secs
```

Clustering sequences by 4-mer similarity:

```
=====
Clusters via relatedness sorting: 100% (0% exclusively)
```

```
Clusters via rare 4-mers: 100% (0% exclusively)
```

```
Estimated clustering effectiveness: 100%
```

```
Time difference of 0.15 secs
```

```
> class(clusters)
```

```
[1] "data.frame"
```

```
> colnames(clusters)
```

```
[1] "cluster_0_5" "cluster_0_4" "cluster_0_3" "cluster_0_2" "cluster_0_1"
```

```
[6] "cluster_0"
```

```
> str(clusters)
```

```
'data.frame': 317 obs. of 6 variables:
```

```
$ cluster_0_5: int 4 4 4 4 4 4 3 3 3 ...
```

```
$ cluster_0_4: int 1 6 6 6 4 4 10 10 10 ...
```

```
$ cluster_0_3: int 53 38 38 38 45 45 42 30 30 30 ...
```

```
$ cluster_0_2: int 1 24 24 24 12 12 16 35 35 35 ...
```

```
$ cluster_0_1: int 87 54 54 54 69 69 64 42 42 42 ...
```

```
$ cluster_0 : int 2 45 45 45 24 24 32 57 57 57 ...
```

```
> apply(clusters, 2, max) # number of clusters per cutoff
cluster_0_5 cluster_0_4 cluster_0_3 cluster_0_2 cluster_0_1   cluster_0
        4          27         53         71         87        102
```

Notice that Clusterize will characterize the clustering based on how many clustered pairs came from relatedness sorting versus rare k-mers, and Clusterize will predict the effectiveness of clustering. Depending on the input sequences, the percentage of clusters originating from relatedness sorting will equalize with the number originating from rare k-mers, but more commonly clusters will originate from one source or the other. The clustering effectiveness formalizes the concept of “inexact” clustering by approximating the fraction of possible sequence pairs that were correctly clustered together. You can incentivize a higher clustering effectiveness by increasing *maxPhase3* at the expense of (proportionally) longer run times.

We can now realize our objective of decreasing the number of sequences. Here, we will prioritize keeping only the longest diverse sequences.

```
> o <- order(clusters[[2]], width(seqs), decreasing=TRUE) # 40% cutoff
> o <- o[!duplicated(clusters[[2]])]
> aa[o]
AAStringSet object of length 27:
  width seq                                         names

```

## 4 Visualize the output of Clusterize

We can scrutinize the clusters by selecting them and looking at their multiple sequence alignment:

```

> t <- table(clusters[[1]]) # select the clusters at a cutoff
> t <- sort(t, decreasing=TRUE)
> head(t)
  4   3   1   2
153 105  47  12
> w <- which(clusters[[1]] == names(t[1]))
> AlignSeqs(seqs[w], verbose=FALSE)
AAStringSet object of length 153:
  width seq                                     names
[1] 287 -MALKNFNPITPSLRELVQVDK...TR-KNKRTSKFIVKKRK---- Rickettsia prowaz...
[2] 287 -MGIRKLKPPTPGQRHKVIGAF...TRAPKKHSSKYIIERRKK---- Porphyromonas gin...
[3] 287 -MGIRKLKPPTPGQRHKVIGAF...TRAPKKHSSKYIIERRKK---- Porphyromonas gin...
[4] 287 -MGIRKLKPPTPGQRHKVIGAF...TRAPKKHSSKYIIERRKK---- Porphyromonas gin...
[5] 287 -MAIVKCKPTSAGRRHVVKIVN...TR-HNKRTDKFIVRRRGK---- Pasteurella multo...
...
[149] 287 -MAFKHFNPPTPGQRQLVIVDR...TR-SNKATDKFIMHTRHQRKK- Bartonella quinta...
[150] 287 -MAFKHFNPPTPGQRQLVIVDR...TR-SNKATDKFIMHTRHQRKK- Bartonella quinta...
[151] 287 -MAIVKCKPTSPGRRHVVKVVN...TR-SNKRTDKFIVRRRTK---- Pectobacterium at...
[152] 287 -MPIQKCKPTSPGRRFVEKVNH...TR-TNKRTTKMIIIRDERRVK--- Acinetobacter sp...
[153] 287 -MALKTFNPTTPGQRQLVMVDR...TR-SNKSTNKFILLSRHKRKK- Bradyrhizobium ja...

```

It's possible to utilize the `heatmap` function to view the clustering results.

As can be seen in Figure 1, `Clusterize` will organize its clusters such that each new cluster is within the previous cluster when `cutoff` is provided in descending order. We can also see that sequences from the same species tend to cluster together, which is an alternative way to systematize sequences without clustering.

```

> aligned_seqs <- AlignSeqs(seqs, verbose=FALSE)
> d <- DistanceMatrix(aligned_seqs, verbose=FALSE)
> tree <- TreeLine(myDistMatrix=d, method="UPGMA", verbose=FALSE)
> heatmap(as.matrix(clusters), scale="column", Colv=NA, Rowv=tree)

```

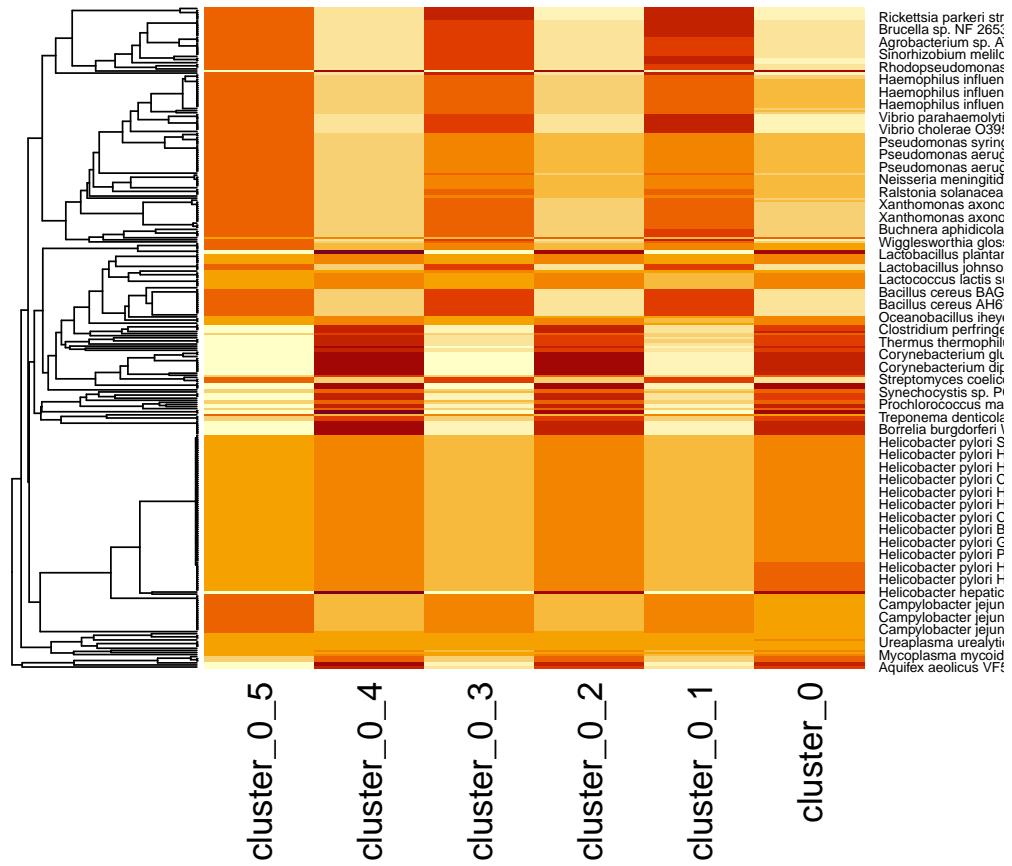

Figure 1: Visualization of the clustering.

## 5 Specialize clustering for your goals

The most common use of clustering is to categorize sequences into groups sharing similarity above a threshold and pick one representative sequence per group. These settings epitomize this typical user scenario:

```
> c1 <- Clusterize(dna, cutoff=0.2, invertCenters=TRUE, processors=1)
Partitioning sequences by 9-mer similarity:

iteration 96 of up to 400 (100.0% coverage)

Time difference of 0.24 secs

Sorting by relatedness within 89 groups:

iteration 37 of up to 37 (100.0% stability)

Time difference of 0.49 secs

Clustering sequences by 9-mer similarity:
=====
Clusters via relatedness sorting: 100% (0% exclusively)
Clusters via rare 6-mers: 100% (0% exclusively)
Estimated clustering effectiveness: 100%
Time difference of 1.52 secs
> w <- which(c1 < 0 & !duplicated(c1))
> dna[w] # select cluster representatives (negative cluster numbers)
DNAStringSet object of length 78:
  width seq                                names
[1]   822 ATGGGAATACGTAAACTCAAGCC...CATCATTGAGAGAAGGAAAAAG Porphyromonas gin...
[2]   825 ATGCCATTGATGAAAGTCAAACC...CATCGCCGCGATCGTAGGGGC Xanthomonas campe...
[3]   837 GTGGGTATTAAGAAGTATAAAC...TGGTCGCCGTCCAGGCAAACAC Lactobacillus pla...
[4]   828 ATGGCAATTAAGAAGTATAAAC...CATTGTACGTCTCGTAAAAAA Bacillus halodura...
[5]   828 ATGGGTATTCTGAATTATCGGCC...GATTGTCCGCCGTGCACCAAA Synechocystis sp...
...
[74]   831 ATGGCATTAAAGCACTTAATCC...TACCGCTCATCAGCGCAAGAAA Bartonella quinta...
[75]   843 ATGTTAAGAAATATCGACCTGT...CGTAAACGTCGAAGGAAGAAG Candidatus Protoc...
[76]   822 ATGCCTATTCAAAATGCAAACC...TATTCCGATCGTCGTCAAG Acinetobacter sp...
[77]   864 ATGGGCATTCGCGTTACCGACC...GGGTCCGGTGGTCGTCAAG Thermosynechococc...
[78]   840 ATGGGCATTCGCAAATATCGACC...CAAGACGGCTTCCGGCGAGGT Gloeobacter viola...
```

By default, `Clusterize` will cluster sequences with linkage to the representative sequence in each group, but it is also possible to tell `Clusterize` to minimize the number of clusters by establishing linkage to any sequence in the cluster (i.e., single-linkage):

```
> c2 <- Clusterize(dna, cutoff=0.2, singleLinkage=TRUE, processors=1)
Partitioning sequences by 9-mer similarity:

iteration 96 of up to 400 (100.0% coverage)

Time difference of 0.22 secs
```

```
Sorting by relatedness within 89 groups:
```

```
iteration 37 of up to 37 (100.0% stability)
```

```
Time difference of 0.5 secs
```

```
Clustering sequences by 9-mer similarity:
```

```
=====
```

```
Clusters via relatedness sorting: 100% (0% exclusively)
```

```
Clusters via rare 6-mers: 100% (0% exclusively)
```

```
Estimated clustering effectiveness: 100%
```

```
Time difference of 2.36 secs
```

```
> max(abs(c1)) # center-linkage
```

```
[1] 78
```

```
> max(c2) # single-linkage (fewer clusters, but broader clusters)
```

```
[1] 76
```

It is possible to synthesize a plot showing a cross tabulation of taxonomy and cluster number. We may idealize the clustering as matching taxonomic labels (2), but this is not exactly the case.

```

> genus <- sapply(strsplit(names(dna), " "), `[, 1)
> t <- table(genus, c2[[1]])
> heatmap(sqrt(t), scale="none", Rowv=NA, col=hcl.colors(100))

```

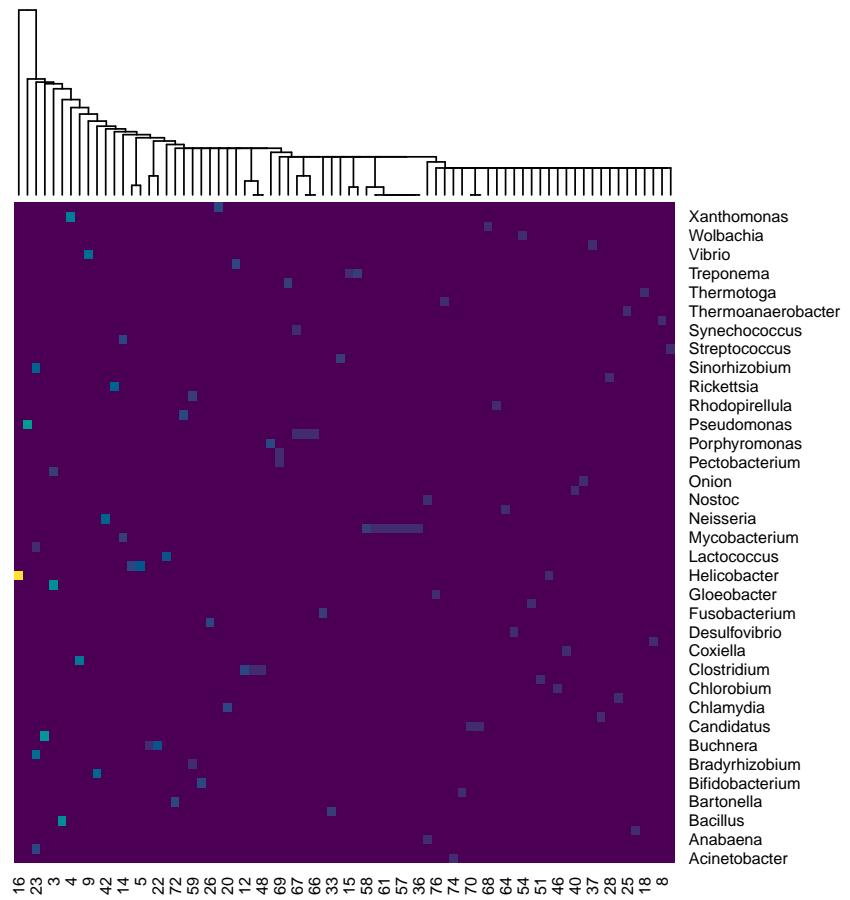

Figure 2: Another visualization of the clustering.

## 6 Finalize your use of Clusterize

Notably, Clusterize is a stochastic algorithm, meaning it will *randomize* which sequences are selected during pre-sorting. Even though the clusters will typically *stabilize* with enough iterations, you can set the random number seed (before every run) to guarantee reproducibility of the clusters:

```
> set.seed(123) # initialize the random number generator
> clusters <- Clusterize(seqs, cutoff=0.1, processors=1)
Partitioning sequences by 6-mer similarity:

iteration 8 of up to 400 (100.0% coverage)

Time difference of 0.03 secs

Sorting by relatedness within 1 group:

iteration 51 of up to 51 (100.0% stability)

Time difference of 0.77 secs

Clustering sequences by 4-mer similarity:
=====
Clusters via relatedness sorting: 100% (0% exclusively)
Clusters via rare 4-mers: 100% (0% exclusively)
Estimated clustering effectiveness: 100%
Time difference of 0.12 secs
> set.seed(NULL) # reset the seed

Now you know how to utilize Clusterize to cluster sequences.
```

## 7 Session Information

All of the output in this vignette was produced under the following conditions:

- R version 4.3.0 RC (2023-04-13 r84266), aarch64-apple-darwin20
- Running under: macOS Monterey 12.6.1
- Matrix products: default
- BLAS:  
`/Library/Frameworks/R.framework/Versions/4.3-arm64/Resources/lib/libRblas.0.dylib`
- LAPACK:  
`/Library/Frameworks/R.framework/Versions/4.3-arm64/Resources/lib/libRlapack.dylib`  
; LAPACK version3.11.0
- Base packages: base, datasets, grDevices, graphics, methods, parallel, stats, stats4, utils
