

Package ‘derfinderPlot’

April 23, 2016

Type Package

Title Plotting functions for derfinder

Version 1.4.1

Date 2015-11-02

Depends R(>= 3.2)

Imports derfinder (>= 1.1.0), GenomeInfoDb (>= 1.3.3),
GenomicFeatures, GenomicRanges (>= 1.17.40), ggbio (>= 1.13.13), ggplot2, IRanges (>= 1.99.28), limma, plyr,
RColorBrewer, reshape2, scales

Suggests biovizBase, bumphunter (>= 1.7.6), derfinderData (>= 0.99.0),
devtools (>= 1.6), knitcitations (>= 1.0.1), knitr (>= 1.6),
BiocStyle, org.Hs.eg.db, rmarkdown (>= 0.3.3), testthat,
TxDb.Hsapiens.UCSC.hg19.knownGene

VignetteBuilder knitr

Description This package provides plotting functions for results from the derfinder package.

License Artistic-2.0

derfinderPlot-package *Plotting functions for derfinder*

Description

Plotting functions for derfinder results

Author(s)

Leonardo Collado-Torres <lcollado@jhu.edu>

derfinderPlot-deprecated
Deprecated functions in package ‘derfinderPlot’

Description

These functions are provided for compatibility with older versions of ‘derfinderPlot’ only, and will be defunct at the next release.

Usage

plot_overview()

plot_cluster()

plot_region_coverage()

Details

The following functions are deprecated and will be made defunct; use the replacement indicated below:

- plot_overview: [plotOverview](#)
- plot_cluster: [plotCluster](#)
- plot_region_coverage: [plotRegionCoverage](#)

plotCluster	<i>Plot the coverage information surrounding a region cluster</i>
-------------	---

Description

For a given region found in [calculatePvalues](#), plot the coverage for the cluster this region belongs to as well as some padding. The mean by group is shown to facilitate comparisons between groups. If annotation exists, you can plot the transcripts and exons (if any) overlapping in the vicinity of the region of interest.

Usage

```
plotCluster(idx, regions, annotation, coverageInfo, groupInfo,
            titleUse = "qval", txdb = NULL, p.ideogram = NULL, ...)
```

Arguments

idx	A integer specifying the index number of the region of interest. This region is graphically highlighted by a red bar.
regions	The \$regions output from calculatePvalues .
annotation	The output from running annotateNearest on the output from calculatePvalues .
coverageInfo	A DataFrame resulting from loadCoverage using cutoff=NULL.
groupInfo	A factor specifying the group membership of each sample. It will be used to color the samples by group.
titleUse	Whether to show the p-value (pval), the q-value (qval) or the FWER adjusted p-value (fwer) in the title. If titleUse=none then no p-value or q-value information is used; useful if no permutations were performed and thus p-value and q-value information is absent.
txdb	A transcript data base such as TxDb.Hsapiens.UCSC.hg19.knownGene. If NULL then no annotation information is used.
p.ideogram	If NULL, the ideogram for hg19 is built for the corresponding chromosome. Otherwise an ideogram resulting from plotIdeogram .
...	Arguments passed to other methods and/or advanced arguments.

Details

See the parameter significantCut in [calculatePvalues](#) for how the significance cutoffs are determined.

Value

A ggplot2 plot that is ready to be printed out. Technically it is a ggbio object. The region with the red bar is the one whose information is shown in the title.

Author(s)

Leonardo Collado-Torres

See Also[loadCoverage](#), [calculatePvalues](#), [annotateNearest](#), [plotIdeogram](#)**Examples**

```
## Load data
library('derfinder')

## Annotate the results with bumpHunter::matchGenes()
library('bumpHunter')
library('TxDb.Hsapiens.UCSC.hg19.knownGene')
library('org.Hs.eg.db')
genes <- annotateTranscripts(txdb = TxDb.Hsapiens.UCSC.hg19.knownGene,
  annotationPackage = 'org.Hs.eg.db')
annotation <- matchGenes(x = genomeRegions$regions, subject = genes)

## Make the plot
plotCluster(idx=1, regions=genomeRegions$regions, annotation=annotation,
  coverageInfo=genomeDataRaw$coverage, groupInfo=genomeInfo$pop,
  txdb=TxDb.Hsapiens.UCSC.hg19.knownGene)
## Resize the plot window and the labels will look good.

## Not run:
## For a custom plot, check the ggBio and ggplot2 packages.
## Also feel free to look at the code for this function:
plotCluster

## End(Not run)
```

plotOverview

Plot a karyotype overview of the genome with the identified regions

Description

Plots an overview of the genomic locations of the identified regions (see [calculatePvalues](#)) in a karyotype view. The coloring can be done either by significant regions according to their p-values, significant by adjusted p-values, or by annotated region if using [annotateNearest](#).

Usage

```
plotOverview(regions, annotation = NULL, type = "pval",
  significantCut = c(0.05, 0.1), ...)
```

Arguments

regions	The \$regions output from calculatePvalues .
annotation	The output from running annotateNearest on the output from calculatePvalues . It is only required if type='annotation'.
type	Must be either pval, qval, fwer or annotation. It determines whether the plot coloring should be done according to significant p-values (<0.05), significant q-values (<0.10), significant FWER adjusted p-values (<0.05) or annotation regions.
significantCut	A vector of length two specifying the cutoffs used to determine significance. The first element is used to determine significance for the p-values and the second element is used for the q-values.
...	Arguments passed to other methods and/or advanced arguments.

Value

A ggplot2 plot that is ready to be printed out. Technically it is a ggbio object.

[calculatePvalues](#), [annotateNearest](#)

Examples

```
## Construct toy data
chr<- paste0('chr', c(1:22, 'X', 'Y'))
chr<- factor(chr, levels=chr)
library('GenomicRanges')
regs<- GRanges(rep(chr, 10), ranges=IRanges(runif(240, 1, 4e7),
width=1e3), significant=sample(c(TRUE, FALSE), 240, TRUE, p=c(0.05,
0.95)), significantQval=sample(c(TRUE, FALSE), 240, TRUE, p=c(0.1,
0.9)), area=rnorm(240))
annotation<- data.frame(region=sample(c('upstream', 'promoter',
"overlaps 5'", 'inside', "overlaps 3'", "close to 3'", 'downstream'),
240, TRUE))

## Type pval
plotOverview(regs)

## Not run:
## Type qval
plotOverview(regs, type='qval')

## Annotation
plotOverview(regs, annotation, type='annotation')
```

```

## Resize the plots if needed.

## You might prefer to leave the legend at ggplot2's default option: right
plotOverview(regs, legend.position='right')

## Although the legend looks better on the bottom
plotOverview(regs, legend.position='bottom')

## Example knitr chunk for higher res plot using the CairoPNG device
```{r overview, message=FALSE, fig.width=7, fig.height=9, dev='CairoPNG', dpi=300}
plotOverview(regs, base_size=30, areaRel=10, legend.position=c(0.95, 0.12))
```

## For more custom plots, take a look at the ggplot2 and ggbio packages
## and feel free to look at the code of this function:
plotOverview

## End(Not run)

```

plotRegionCoverage *Makes plots for every region while summarizing the annotation*

Description

This function takes the regions found in [calculatePvalues](#) and assigns them genomic states constructed with [makeGenomicState](#). The main workhorse functions are [countOverlaps](#) and [findOverlaps](#). For an alternative plot check [plotCluster](#) which is much slower and we recommend it's use only after quickly checking the results with this function.

Usage

```

plotRegionCoverage(regions, regionCoverage, groupInfo, nearestAnnotation,
  annotatedRegions, txdb = NULL, whichRegions = seq_len(min(100,
    length(regions))), colors = NULL, scalefac = 32, ask = interactive(),
  ylab = "Coverage", verbose = TRUE)

```

Arguments

| | |
|-------------------|---|
| regions | The \$regions output from calculatePvalues . |
| regionCoverage | The output from getRegionCoverage used on regions. |
| groupInfo | A factor specifying the group membership of each sample. It will be used to color the samples by group. |
| nearestAnnotation | The output from annotateNearest used on regions. |
| annotatedRegions | The output from annotateRegions used on regions. |
| txdb | A TxDb object. If specified, transcript annotation will be extracted from this object and used to plot the transcripts. |

| | |
|--------------|--|
| whichRegions | An integer vector with the index of the regions to plot. |
| colors | If NULL then brewer.pal with the 'Dark2' color scheme is used. |
| scafac | The parameter used in preprocessCoverage . |
| ask | If TRUE then the user is prompted before each plot is made. |
| ylab | The name of the of the Y axis. |
| verbose | If TRUE basic status updates will be printed along the way. |

Value

A plot for every region showing the coverage of each sample at each base of the region as well as the summarized annotation information.

Andrew Jaffe, Leonardo Collado-Torres

See Also

[calculatePvalues](#), [getRegionCoverage](#), [annotateNearest](#), [annotateRegions](#), [plotCluster](#)

Examples

```
## Load data
library('derfinder')

## Annotate regions, first two regions only
regions <- genomeRegions$regions[1:2]
annotatedRegions <- annotateRegions(regions = regions,
  genomicState = genomicState$fullGenome, minoverlap = 1)

## Find nearest annotation with bumpHunter::matchGenes()
library('bumpHunter')
library('TxDb.Hsapiens.UCSC.hg19.knownGene')
genes <- annotateTranscripts(txdb = TxDb.Hsapiens.UCSC.hg19.knownGene)
nearestAnnotation <- matchGenes(x = regions, subject = genes)

## Obtain fullCov object
fullCov <- list('21'=genomeDataRaw$coverage)

## Assign chr lengths using hg19 information
library('GenomicRanges')
data(hg19Ideogram, package = 'biovizBase', envir = environment())
seqlengths(regions) <- seqlengths(hg19Ideogram)[names(seqlengths(regions))]

## Get the region coverage
regionCov <- getRegionCoverage(fullCov=fullCov, regions=regions)
## Make plots for the regions
plotRegionCoverage(regions=regions, regionCoverage=regionCov,
  groupInfo=genomeInfo$pop, nearestAnnotation=nearestAnnotation,
  annotatedRegions=annotatedRegions, whichRegions=1:2)
```

```

## Re-make plots with transcript information
plotRegionCoverage(regions=regions, regionCoverage=regionCov,
  groupInfo=genomeInfo$pop, nearestAnnotation=nearestAnnotation,
  annotatedRegions=annotatedRegions, whichRegions=1:2,
  txdb = TxDb.Hsapiens.UCSC.hg19.knownGene)

## Not run:
## If you prefer, you can save the plots to a pdf file
pdf('ders.pdf', h = 6, w = 9)
plotRegionCoverage(regions=regions, regionCoverage=regionCov,
  groupInfo=genomeInfo$pop, nearestAnnotation=nearestAnnotation,
  annotatedRegions=annotatedRegions, whichRegions=1:2,
  txdb = TxDb.Hsapiens.UCSC.hg19.knownGene, ask = FALSE)
dev.off()

## End(Not run)

```

vennRegions

Venn diagram for annotated regions given the genomic state

Description

Makes a venn diagram for the regions given the genomic state showing how many regions overlap introns, exons, intergenic regions, none or multiple groups.

Usage

```
vennRegions(annotatedRegions, subsetIndex = NULL, ...)
```

Arguments

| | |
|------------------|---|
| annotatedRegions | The output from annotateRegions used on regions. |
| subsetIndex | A vector of to use to subset the regions to use for the venn diagram. It can be a logical vector of length equal to the number of regions or an integer vector. If NULL, then it's ignored. |
| ... | Arguments passed to vennDiagram . |

Value

Makes a venn diagram plot for the annotation given the genomic state and the actual venn counts used to make the plot.

[annotateRegions](#), [vennCounts](#), [vennDiagram](#)

Examples

```
## Load data
library('derfinder')

## Annotate regions
annotatedRegions <- annotateRegions(regions = genomeRegions$regions,
  genomicState = genomicState$fullGenome, minoverlap = 1)

## Make venn diagram
venn <- vennRegions(annotatedRegions)

## Add title and choose text color
venn2 <- vennRegions(annotatedRegions, main = 'Venn diagram', counts.col =
  'blue')

## Subset to only significant regions, so you don't have to annotate them
## again
venn3 <- vennRegions(annotatedRegions, subsetIndex =
  genomeRegions$regions$significant == 'TRUE', main = 'Significant only')
```
