## LowMACAAnnotation

April 10, 2016

getLowMACAAnnotationData

Retrieve Data from LowMACAAnnotation Package

## Description

Functions to retrieve protein level, Pfam level and aliases data from LowMACAAnnotation Package.

## Usage

```
## Retrieve the dataset containing protein level information
getMyUni()

## Retrieve the dataset containing Pfam level information
getMyPfam()

## Retrieve the dataset containing Gene Symbols aliases
getMyAlias()
```

## Value

All the functions return dataframes

#### See Also

```
myUni myPfam myAlias
```

```
myUni <- getMyUni()
myPfam <- getMyPfam()
myAlias <- getMyAlias()</pre>
```

2 myAlias

myAlias

Gene Symbol aliases for LowMACA package

## **Description**

A simple parsing of the HGNC database to map aliases and previous symbols to correct official Gene Symbols

## Usage

```
data("myAlias")
```

#### **Format**

A data frame with the following 2 variables.

Alias a character vector representing all the possible aliases and previous symbols for official Gene Symbols

Official\_Gene\_Symbol a character vector representing the approved and official Gene Symbol for HGNC database

Locus\_Group a character vector representing all the possible locus groups in HGNC database, like protein coding, RNA, pseudogene etc.

Locus\_Type a character vector representing all the possible locus types in HGNC database. It is a specification of locus group

MappedByLowMACA a character vector of yes and no if the gene is included in myUni.RData

#### **Source**

**HGNC** 

```
#Load myAlias and show its structure
myAlias <- getMyAlias()
str(myAlias)</pre>
```

myPfam 3

myPfam

Pfam-A for LowMACA package

#### Description

This dataset comprises all the Pfam-A entries mapped for LowMACA

## Usage

```
data("myPfam")
```

#### **Format**

A data frame with the following 11 variables.

**Entry** a character vector of Uniprot entries

Envelope\_Start a numeric vector of starts of the pfam domain relative to the reference protein

Envelope\_End a numeric vector of ends of the pfam domain relative to the reference protein

Pfam\_ID a character vector of Pfam IDs in the form of PF##### supported by LowMACA

Pfam\_Name a character vector of full Pfam domain names

Type a character vector. One of the following: "Domain" "Family" "Repeat" or "Motif"

Clan ID a numeric vector of Clan IDs, a sort of families of Pfam domains

Entrez a numeric vector of Entrez IDs

UNIPROT a character vector of Uniprot entries in format "name\_HUMAN"

Gene\_Symbol a character vector of official Gene Symbols

Pfam\_Fasta a character vector of amino acid sequences of corresponding Pfam

#### **Details**

This is the result of a merge between Pfam-A, Uniprot, HGNC databases

#### Source

Pfam website

```
#Load and show contents of myPfam
data(myPfam)
str(myPfam)
```

4 myUni

myUni

Uniprot database for LowMACA

## Description

This dataset comprises all the Uniprot entries mapped for LowMACA

## Usage

```
data("myUni")
```

#### **Format**

A data frame with 9 variables.

Gene\_Symbol a character vector of official Gene Symbols

Entrez a numeric vector of Entrez IDs

UNIPROT a character vector of Uniprot entries in "name\_HUMAN" format

Entry a character vector of Uniprot entries

HGNC a character vector of gene names as HGNC numbers

Approved\_Name a character vector of approved extended gene names

Protein.name a character vector of approved extended protein names

Chromosome a character vector of chromosomic cytoband positions

AMINO\_SEQ a character vector of amino acid sequences for Uniprot entries

## Details

This dataset is a 1 to 1 mapping of genes to their canonical proteins or main proteins

## Source

## Uniprot

```
#Load dataset and show its structure
data(myUni)
str(myUni)
```
