### **Description**

chromstaR-package

This package implements functions for the combinatorial and differential analysis of ChIP-seq data. It was developed for histone modifications with a broad profile but is also suitable for the analysis of transcription factor binding data. A Hidden Markov Model with a mixture of Negative Binomials as emission densities is used to call peaks. Please refer to our manuscript at http://dx.doi.org/10.1101/038612 for a detailed description of the method.

### **Details**

The main function of this package is Chromstar. For a detailed introduction type browseVignettes("chromstaR") and read the vignette. Here is an overview of all plotting functions.

# Author(s)

Aaron Taudt, Maria Colome-Tatche, Matthias Heinig, Minh Anh Nguyen

### **Description**

A GRanges-class object which contains binned read counts as meta data column counts. It is output of the binReads function.

4 binReads

binReads	Convert aligned reads from various file formats into read counts in equidistant bins

### **Description**

Convert aligned reads in .bam or .bed(.gz) format into read counts in equidistant windows.

### Usage

```
binReads(file, experiment.table = NULL, ID = NULL, assembly,
 bamindex = file, chromosomes = NULL, pairedEndReads = FALSE,
 min.mapq = 10, remove.duplicate.reads = TRUE, max.fragment.width = 1000,
 blacklist = NULL, binsizes = 1000, stepsizes = binsizes/2,
 reads.per.bin = NULL, bins = NULL, variable.width.reference = NULL,
  use.bamsignals = TRUE, format = NULL)
```

### **Arguments**

file	A file with aligned reads. Alternatively a GRanges-class with aligned reads.						
experiment.tab	le						
	An experiment.table containing the supplied file. This is necessary to uniquely identify the file in later steps of the workflow. Set to NULL if you don't have it (not recommended).						
ID	Optional ID to select a row from the experiment.table. Only necessary if the experiment table contains the same file in multiple positions in column 'file'.						
assembly	Please see fetchExtendedChromInfoFromUCSC for available assemblies. Only necessary when importing BED files. BAM files are handled automatically. Alternatively a data.frame with columns 'chromosome' and 'length'.						

bamindex BAM index file. Can be specified without the .bai ending. If the index file does

not exist it will be created and a warning is issued.

If only a subset of the chromosomes should be binned, specify them here. chromosomes

pairedEndReads Set to TRUE if you have paired-end reads in your BAM files (not implemented

for BED files).

min.mapq Minimum mapping quality when importing from BAM files. Set min.mapq=0

to keep all reads.

remove.duplicate.reads

A logical indicating whether or not duplicate reads should be removed.

max.fragment.width

blacklist

Maximum allowed fragment length. This is to filter out erroneously wrong fragments due to mapping errors of paired end reads.

A GRanges-class or a bed(.gz) file with blacklisted regions. Reads falling into

those regions will be discarded.

binsizes An integer vector specifying the bin sizes to use.

stepsizes An integer vector specifying the step size. One number can be given for each

element in binsizes, reads.per.bin and bins (in that order).

Approximate number of desired reads per bin. The bin size will be selected reads.per.bin

accordingly.

callPeaksMultivariate 5

bins A GRanges-class or a named list() with GRanges-class containing precal-

culated bins produced by fixedWidthBins or variableWidthBins. Names of the list must correspond to the binsize. If the list is unnamed, an attempt is made

to automatically determine the binsize.

variable.width.reference

 $A\ BAM\ file\ that\ is\ used\ as\ reference\ to\ produce\ variable\ width\ bins.\ See\ variable\ Width\ Bins$ 

for details.

use.bamsignals If TRUE the bamsignals package is used for parsing of BAM files. This gives

tremendous speed advantage for only one binsize but linearly increases for multiple binsizes, while use.bamsignals=FALSE has a binsize dependent runtime

and might be faster if many binsizes are calculated.

format One of c('bed', 'bam', 'GRanges', NULL). With NULL the format is determined

automatically from the file ending.

#### **Details**

Convert aligned reads from .bam or .bed(.gz) files into read counts in equidistant windows (bins). This function uses GenomicRanges::countOverlaps to calculate the read counts, or alternatively bamsignals::bamProfile if option use.bamsignals is set (only effective for .bam files).

#### Value

If only one bin size was specified for option binsizes, the function returns a single GRanges-class object with meta data column 'counts' that contains the read count. If multiple binsizes were specified, the function returns a named list() of GRanges-class objects.

### **Examples**

callPeaksMultivariate Fit a Hidden Markov Model to multiple ChIP-seq samples

# Description

Fit a HMM to multiple ChIP-seq samples to determine the combinatorial state of genomic regions. Input is a list of uniHMMs generated by callPeaksUnivariate.

6 callPeaksMultivariate

### Usage

```
callPeaksMultivariate(hmms, use.states, max.states = NULL, per.chrom = TRUE,
  chromosomes = NULL, eps = 0.01, keep.posteriors = FALSE,
  num.threads = 1, max.time = NULL, max.iter = NULL,
  keep.densities = FALSE, verbosity = 1, temp.savedir = NULL)
```

### **Arguments**

hmms	A list of uniHMMs generated by callPeaksUnivariate, e.g. list(hmm1, hmm2,) or a vector of files that contain such objects, e.g. c("file1", "file2",).
use.states	A data.frame with combinatorial states which are used in the multivariate HMM, generated by function stateBrewer. If both use.states and max.states are NULL, the maximum possible number of combinatorial states will be used.
max.states	Maximum number of combinatorial states to use in the multivariate HMM. The states are ordered by occurrence as determined from the combination of univariate state calls.
per.chrom	If per.chrom=TRUE chromosomes will be treated separately. This tremendously speeds up the calculation but results might be noisier as compared to per.chrom=FALSE, where all chromosomes are concatenated for the HMM.
chromosomes	A vector specifying the chromosomes to use from the models in hmms. The default (NULL) uses all available chromosomes.
eps	Convergence threshold for the Baum-Welch algorithm.
keep.posteriors	
	If set to TRUE, posteriors will be available in the output. This can be useful to change the posterior cutoff later, but increases the necessary disk space to store the result immensely.
num.threads	Number of threads to use. Setting this to >1 may give increased performance.
max.time	The maximum running time in seconds for the Baum-Welch algorithm. If this time is reached, the Baum-Welch will terminate after the current iteration finishes. The default NULL is no limit.
max.iter	The maximum number of iterations for the Baum-Welch algorithm. The default NULL is no limit.
keep.densities	If set to TRUE (default=FALSE), densities will be available in the output. This should only be needed debugging.
verbosity	Verbosity level for the fitting procedure. 0 - No output, 1 - Iterations are printed.
temp.savedir	A directory where to store intermediate results if per.chrom=TRUE.

### Details

Emission distributions from the univariate HMMs are used with a Gaussian copula to generate a multivariate emission distribution for each combinatorial state. This multivariate distribution is then kept fixed and the transition probabilities are fitted with a Baum-Welch. Please refer to our manuscript at http://dx.doi.org/10.1101/038612 for a detailed description of the method.

### Value

A multiHMM object.

callPeaksReplicates 7

# Check some plots
heatmap Transition Probs (\verb|multimodel|)
heatmapCountCorrelation(multimodel)
```

 ${\tt callPeaksReplicates}$ 

Fit a multivariate Hidden Markov Model to multiple ChIP-seq replicates

# Description

Fit an HMM to multiple ChIP-seq replicates and derive correlation measures. Input is a list of uniHMMs generated by callPeaksUnivariate.

# Usage

```
callPeaksReplicates(hmm.list, max.states = 32, force.equal = FALSE,
  eps = 0.01, max.iter = NULL, max.time = NULL, keep.posteriors = TRUE,
  num.threads = 1, max.distance = 0.2, per.chrom = TRUE)
```

8 callPeaksReplicates

### **Arguments**

hmm.list	A list of uniHMMs generated by callPeaksUnivariate, e.g. list(hmm1,hmm2,) or c("file1", "file2",). Alternatively, this parameter also accepts a multiHMM and will check if the distance between replicates is greater than max.distance.
max.states	The maximum number of combinatorial states to consider. The default (32) is sufficient to treat up to 5 replicates exactly and more than 5 replicates approximately.
force.equal	The default (FALSE) allows replicates to differ in their peak-calls, although the majority will usually be identical. If force.equal=TRUE, all peaks will be identical among all replicates.
eps	Convergence threshold for the Baum-Welch algorithm.
max.iter	The maximum number of iterations for the Baum-Welch algorithm. The default NULL is no limit.
max.time	The maximum running time in seconds for the Baum-Welch algorithm. If this time is reached, the Baum-Welch will terminate after the current iteration finishes. The default NULL is no limit.
keep.posterior	S
	If set to TRUE, posteriors will be available in the output. This is useful to change the post.cutoff later, but increases the necessary disk space to store the result immense.
num.threads	Number of threads to use. Setting this to >1 may give increased performance.
max.distance	This number is used as a cutoff to group replicates based on their distance matrix. The lower this number, the more similar replicates have to be to be grouped together.
per.chrom	If per.chrom=TRUE chromosomes will be treated separately. This tremendously speeds up the calculation but results might be noisier as compared to per.chrom=FALSE, where all chromosomes are concatenated for the HMM.

# Value

Output is a multiHMM object with additional entry replicateInfo. If only one uniHMM was given as input, a simple list() with the replicateInfo is returned.

# Author(s)

Aaron Taudt

callPeaksUnivariate 9

callPeaksUnivariate

Fit a Hidden Markov Model to a ChIP-seq sample.

### **Description**

Fit a HMM to a ChIP-seq sample to determine the modification state of genomic regions, e.g. call peaks in the sample.

### Usage

```
callPeaksUnivariate(binned.data, control.data = NULL, prefit.on.chr = NULL,
    short = TRUE, eps = 0.1, init = "standard", max.time = NULL,
    max.iter = 5000, num.trials = 1, eps.try = NULL, num.threads = 1,
    read.cutoff = TRUE, read.cutoff.quantile = 1,
    read.cutoff.absolute = 500, max.mean = Inf, post.cutoff = 0.5,
    control = FALSE, keep.posteriors = FALSE, keep.densities = FALSE,
    verbosity = 1)
```

# **Arguments**

binned.data	A GRanges-class object with binned read counts or a file that contains such an object.
control.data	Input control for the experiment. A GRanges-class object with binned read counts or a file that contains such an object.
prefit.on.chr	A chromosome that is used to pre-fit the Hidden Markov Model. Set to NULL if you don't want to prefit but use the whole genome instead.
short	If TRUE, the second fitting step is only done with one iteration.
eps	Convergence threshold for the Baum-Welch algorithm.
init	One of the following initialization procedures:
	standard The negative binomial of state 'unmodified' will be initialized with mean=mean(counts), var=var(counts) and the negative binomial of state 'modified' with mean=mean(counts)+1, var=var(counts). This procedure usually gives the fastest convergence.

10 callPeaksUnivariate

random Mean and variance of the negative binomials will be initialized with random values (in certain boundaries, see source code). Try this if the 'standard' procedure fails to produce a good fit.

empiric Yet another way to initialize the Baum-Welch. Try this if the other two methods fail to produce a good fit.

max.time The maximum running time in seconds for the Baum-Welch algorithm. If this time is reached, the Baum-Welch will terminate after the current iteration finishes. The default NULL is no limit.

max.iter The maximum number of iterations for the Baum-Welch algorithm. The default NULL is no limit.

num.trials The number of trials to run the HMM. Each time, the HMM is seeded with different random initial values. The HMM with the best likelihood is given as output.

eps.try If code num.trials is set to greater than 1, eps.try is used for the trial runs. If unset, eps is used.

num. threads Number of threads to use. Setting this to >1 may give increased performance.

read.cutoff The default (TRUE) enables filtering of high read counts. Set read.cutoff=FALSE to disable this filtering.

#### read.cutoff.quantile

A quantile between 0 and 1. Should be near 1. Read counts above this quantile will be set to the read count specified by this quantile. Filtering very high read counts increases the performance of the Baum-Welch fitting procedure. However, if your data contains very few peaks they might be filtered out. If option read.cutoff.absolute is also specified, the minimum of the resulting cutoff values will be used. Set read.cutoff=FALSE to disable this filtering.

### read.cutoff.absolute

Read counts above this value will be set to the read count specified by this value. Filtering very high read counts increases the performance of the Baum-Welch fitting procedure. However, if your data contains very few peaks they might be filtered out. If option read.cutoff.quantile is also specified, the minimum of the resulting cutoff values will be used. Set read.cutoff=FALSE to disable this filtering.

max.mean If mean(counts)>max.mean, bins with low read counts will be set to 0. This is a workaround to obtain good fits in the case of large bin sizes.

post.cutoff False discovery rate. codeNULL means that the state with maximum posterior probability will be chosen, irrespective of its absolute probability (default=codeNULL).

control If set to TRUE, the binned data will be treated as control experiment. That means only state 'zero-inflation' and 'unmodified' will be used in the HMM.

### keep.posteriors

If set to TRUE (default=FALSE), posteriors will be available in the output. This is useful to change the post.cutoff later, but increases the necessary disk space to store the result.

keep.densities If set to TRUE (default=FALSE), densities will be available in the output. This should only be needed debugging.

verbosity Verbosity level for the fitting procedure. 0 - No output, 1 - Iterations are printed.

callPeaksUnivariateAllChr 11

#### **Details**

This function is similar to callPeaksUnivariateAllChr but allows to pre-fit on a single chromosome instead of the whole genome. This gives a significant performance increase and can help to converge into a better fit in case of unsteady quality for some chromosomes.

### Value

A uniHMM object.

#### Author(s)

Aaron Taudt, Maria Colome Tatche

### See Also

```
uniHMM, callPeaksMultivariate
```

### **Examples**

callPeaksUnivariateAllChr

Fit a Hidden Markov Model to a ChIP-seq sample.

### **Description**

Fit a HMM to a ChIP-seq sample to determine the modification state of genomic regions, e.g. call peaks in the sample.

### Usage

```
callPeaksUnivariateAllChr(binned.data, control.data = NULL, eps = 0.01,
  init = "standard", max.time = NULL, max.iter = NULL, num.trials = 1,
  eps.try = NULL, num.threads = 1, read.cutoff = TRUE,
  read.cutoff.quantile = 1, read.cutoff.absolute = 500, max.mean = Inf,
  post.cutoff = 0.5, control = FALSE, keep.posteriors = FALSE,
  keep.densities = FALSE, verbosity = 1)
```

### **Arguments**

binned.data A GRanges-class object with binned read counts or a file that contains such an

object.

control.data Input control for the experiment. A GRanges-class object with binned read

counts or a file that contains such an object.

eps Convergence threshold for the Baum-Welch algorithm.

init One of the following initialization procedures:

standard The negative binomial of state 'unmodified' will be initialized with mean=mean(counts), var=var(counts) and the negative binomial of state 'modified' with mean=mean(counts)+1, var=var(counts). This procedure usually gives the fastest convergence.

random Mean and variance of the negative binomials will be initialized with random values (in certain boundaries, see source code). Try this if the 'standard' procedure fails to produce a good fit.

empiric Yet another way to initialize the Baum-Welch. Try this if the other two methods fail to produce a good fit.

max. time The maximum running time in seconds for the Baum-Welch algorithm. If this

time is reached, the Baum-Welch will terminate after the current iteration finishes. The default NULL is no limit.

max.iter The maximum number of iterations for the Baum-Welch algorithm. The default

NULL is no limit.

num.trials The number of trials to run the HMM. Each time, the HMM is seeded with

different random initial values. The HMM with the best likelihood is given as

output.

eps.try If code num.trials is set to greater than 1, eps.try is used for the trial runs. If

unset, eps is used.

num. threads Number of threads to use. Setting this to >1 may give increased performance.

read.cutoff The default (TRUE) enables filtering of high read counts. Set read.cutoff=FALSE

to disable this filtering.

read.cutoff.quantile

A quantile between 0 and 1. Should be near 1. Read counts above this quantile will be set to the read count specified by this quantile. Filtering very high read counts increases the performance of the Baum-Welch fitting procedure. However, if your data contains very few peaks they might be filtered out. If option read.cutoff.absolute is also specified, the minimum of the resulting cutoff values will be used. Set read.cutoff=FALSE to disable this filtering.

read.cutoff.absolute

Read counts above this value will be set to the read count specified by this value. Filtering very high read counts increases the performance of the Baum-Welch fitting procedure. However, if your data contains very few peaks they might be filtered out. If option read.cutoff.quantile is also specified, the minimum of the resulting cutoff values will be used. Set read.cutoff=FALSE to disable this filtering

this filtering.

max.mean If mean(counts)>max.mean, bins with low read counts will be set to 0. This is

a workaround to obtain good fits in the case of large bin sizes.

post.cutoff False discovery rate. codeNULL means that the state with maximum posterior

probability will be chosen, irrespective of its absolute probability (default=codeNULL).

changeMaxPostCutoff

control If set to TRUE, the binned data will be treated as control experiment. That means only state 'zero-inflation' and 'unmodified' will be used in the HMM.

keep.posteriors

If set to TRUE (default=FALSE), posteriors will be available in the output. This is useful to change the post.cutoff later, but increases the necessary disk space to store the result.

13

 ${\tt keep.densities} \ \ {\tt If set to TRUE \ (default=FALSE)}, \ densities \ will \ be \ available \ in \ the \ output. \ This$ 

should only be needed debugging.

verbosity Verbosity level for the fitting procedure. 0 - No output, 1 - Iterations are printed.

#### **Details**

The Hidden Markov Model which is used to classify the bins uses 3 states: state 'zero-inflation' with a delta function as emission densitiy (only zero read counts), 'unmodified' and 'modified' with Negative Binomials as emission densities. A Baum-Welch algorithm is employed to estimate the parameters of the distributions. Please refer to our manuscript at http://dx.doi.org/10.1101/038612 for a detailed description of the method.

#### Value

A uniHMM object.

### Author(s)

Aaron Taudt, Maria Coome Tatche

### See Also

uniHMM, callPeaksMultivariate

changeMaxPostCutoff Adjust sensitivity of peak detection

### **Description**

Adjusts the peak calls of a uniHMM, multiHMM or combinedMultiHMM object with a cutoff on the maximum-posterior within each peak. Higher values of maxPost.cutoff mean less sensitive and more precise peak calls. Remaining peaks are kept intact, as opposed to function changePostCutoff, where broad peaks are fragmented. This function was formerly called 'changeFDR' and is still available for backwards compatibility.

### Usage

```
changeMaxPostCutoff(model, maxPost.cutoff = 0.99, invert = FALSE)
changeFDR(model, fdr = 0.01, invert = FALSE)
```

### Arguments

model A uniHMM or multiHMM object with posteriors.

maxPost.cutoff A vector of values between 0 and 1 for each column in model\$bins\$posteriors.

If only one value is given, it will be reused for all columns. Values close to 1 will yield more stringent peak calls with lower false positive but higher false

negative rate (i.e. more precise but less sensitive).

invert Select peaks below (FALSE) or above (TRUE) the given maxPost.cutoff. This

is useful to select low confidence peaks.

fdr Same as 1-maxPost.cutoff.

### **Details**

Each peak has a maximum-posterior (maxPostInPeak, between 0 and 1) associated. The sensitivity is adjusted with a simple cutoff on maxPostInPeak, e.g. for maxPost.cutoff = 0.99 only peaks with maxPostInPeak >= 0.99 will be selected.

#### Value

The input object is returned with adjusted peak calls.

#### **Functions**

• changeFDR: This function was renamed to 'changeMaxPostCutoff' in chromstaR 1.5.1 but it still available for backwards compatibility.

changePostCutoff

Change the posterior cutoff of a Hidden Markov Model

### **Description**

Adjusts the peak calls of a uniHMM, multiHMM or combinedMultiHMM object with the given posterior cutoff.

# Usage

```
changePostCutoff(model, post.cutoff = 0.5)
```

### Arguments

model A uniHMM or multiHMM object with posteriors.

post.cutoff A vector of posterior cutoff values between 0 and 1 the same length as ncol(model\$bins\$posterior If only one value is given, it will be reused for all columns. Values close to 1

If only one value is given, it will be reused for all columns. Values close to 1 will yield more stringent peak calls with lower false positive but higher false

negative rate.

#### **Details**

Posterior probabilities are between 0 and 1. Peaks are called if the posteriors for a state (univariate) or sample (multivariate) are >= post.cutoff.

# Value

The input object is returned with adjusted peak calls.

```

Chromstar

Wrapper function for the chromstaR package

### **Description**

This function performs binning, univariate peak calling and multivariate peak calling from a list of input files.

#### Usage

```
Chromstar(inputfolder, experiment.table, outputfolder, configfile = NULL, numCPU = 1, binsize = 1000, stepsize = binsize/2, assembly = NULL, chromosomes = NULL, remove.duplicate.reads = TRUE, min.mapq = 10, format = NULL, prefit.on.chr = NULL, eps.univariate = 0.1, max.time = NULL, max.iter = 5000, read.cutoff.absolute = 500, keep.posteriors = TRUE, mode = "differential", max.states = 128, per.chrom = TRUE, eps.multivariate = 0.01, exclusive.table = NULL)
```

### **Arguments**

Chromstar 17

configfile A file specifying the parameters of this function (without inputfolder, outputfolder

and configfile). Having the parameters in a file can be handy if many samples with the same parameter settings are to be run. If a configfile is specified, it

will take priority over the command line parameters.

numCPU Number of threads to use for the analysis. Beware that more CPUs also means

more memory is needed. If you experience crashes of R with higher numbers of

this parameter, leave it at numCPU=1.

binsize An integer specifying the bin size that is used for the analysis.

stepsize An integer specifying the step size for analysis.

assembly A data.frame or tab-separated file with columns 'chromosome' and 'length'.

Alternatively a character specifying the assembly, see fetchExtendedChromInfoFromUCSC

for available assemblies. Specifying an assembly is only necessary when im-

porting BED files. BAM files are handled automatically.

chromosomes If only a subset of the chromosomes should be imported, specify them here.

remove.duplicate.reads

A logical indicating whether or not duplicate reads should be removed.

min.mapq Minimum mapping quality when importing from BAM files. Set min.mapq=0

to keep all reads.

format One of c('bed', 'bam', NULL). With NULL the format is determined automati-

cally from the file ending.

prefit.on.chr A chromosome that is used to pre-fit the Hidden Markov Model. Set to NULL if

you don't want to prefit but use the whole genome instead.

eps.univariate Convergence threshold for the univariate Baum-Welch algorithm.

max.time The maximum running time in seconds for the Baum-Welch algorithm. If this

time is reached, the Baum-Welch will terminate after the current iteration fin-

ishes. The default NULL is no limit.

max.iter The maximum number of iterations for the Baum-Welch algorithm. The default

NULL is no limit.

read.cutoff.absolute

Read counts above this value will be set to the read count specified by this value. Filtering very high read counts increases the performance of the Baum-Welch fitting procedure. However, if your data contains very few peaks they might be filtered out. If option read.cutoff.quantile is also specified, the minimum of the resulting cutoff values will be used. Set read.cutoff=FALSE to disable

this filtering.

keep.posteriors

If set to TRUE (default=FALSE), posteriors will be available in the output. This is useful to change the post.cutoff later, but increases the necessary disk space to

store the result.

One of c('differential','combinatorial','full'). The modes determine how the multivariate part is run. Here is some advice which mode to

use

combinatorial Each condition is analyzed separately with all marks combined. Choose this mode if you have more than ~7 conditions or you want to have a high sensitivity for detecting combinatorial states. Differences between conditions will be more noisy (more false positives) than in mode 'differential' but combinatorial states are more precise.

mode

18 chromstaR-objects

differential Each mark is analyzed separately with all conditions combined.

Choose this mode if you are interested in accurate differences. Combinatorial states will be more noisy (more false positives) than in mode 'combinatorial' but differences are more precise.

full Full analysis of all marks and conditions combined. Best of both, but: Choose this mode only if (number of conditions \* number of marks  $\leq 8$ ), otherwise it might be too slow or crash due to memory limitations.

separate Only replicates are analyzed multivariately. Combinatorial states are constructed by a simple post-hoc combination of peak calls.

max.states

The maximum number of states to use in the multivariate part. If set to NULL, the maximum number of theoretically possible states is used. CAUTION: This can be very slow or crash if you have too many states. **chromstaR** has a built in mechanism to select the best states in case that less states than theoretically possible are specified.

per.chrom

If set to TRUE chromosomes will be treated separately in the multivariate part. This tremendously speeds up the calculation but results might be noisier as compared to per.chrom=FALSE, where all chromosomes are concatenated for the HMM.

eps.multivariate

Convergence threshold for the multivariate Baum-Welch algorithm.

exclusive.table

A data.frame or tab-separated file with columns 'mark' and 'group'. Histone marks with the same group will be treated as mutually exclusive.

#### Value

NULL

collapseBins 19

### **Description**

chromstaR defines several objects.

- uniHMM: Returned by callPeaksUnivariate.
- multiHMM: Returned by callPeaksMultivariate and callPeaksReplicates.
- combinedMultiHMM: Returned by combineMultivariates.

### **Description**

The function will collapse consecutive bins which have, for example, the same combinatorial state.

### Usage

```
collapseBins(data, column2collapseBy = NULL, columns2sumUp = NULL,
  columns2average = NULL, columns2getMax = NULL, columns2drop = NULL)
```

### **Arguments**

data A data.frame containing the genomic coordinates in the first three columns. column2collapseBy

The number of the column which will be used to collapse all other inputs. If a set of consecutive bins has the same value in this column, they will be aggregated into one bin with adjusted genomic coordinates.

columns2sumUp 
 Column numbers that will be summed during the aggregation process. columns2average

Column numbers that will be averaged during the aggregation process.

 ${\tt columns2getMax} \quad {\tt Column\ numbers\ where\ the\ maximum\ will\ be\ chosen\ during\ the\ aggregation\ process.}$ 

 ${\tt column \, s2drop} \qquad {\tt Column \, numbers \, that \, will \, be \, dropped \, after \, the \, aggregation \, process.}$ 

#### **Details**

The following tables illustrate the principle of the collapsing: Input data:

seqnames	start	end	column2collapseBy	moreColumns	columns2sumUp
chr1	0	199	2	1 10	1 3
chr1	200	399	2	2 11	03
chr1	400	599	2	3 12	13
chr1	600	799	1	4 13	0 3
chr1	800	999	1	5 14	13

### Output data:

```
seqnames start end column2collapseBy moreColumns columns2sumUp
```

20 combinatorialStates

chr1	0	599	2	1 10	29
chr1	600	999	1	4 13	16

### Value

A data.frame.

#### Author(s)

Aaron Taudt

### **Examples**

combinatorial States

Get the (decimal) combinatorial states of a list of univariate HMM models

# Description

Get the combinatorial states of a list of models generated by callPeaksUnivariate. The function returns the decimal combinatorial states for each bin (see details for an explanation of combinatorial state).

### Usage

```
combinatorialStates(hmm.list, binary = FALSE)
```

# Arguments

hmm.list A list of models generated by callPeaksUnivariate, e.g. 'list(model1,model2,...)'. binary If TRUE, a matrix of binary instead of decimal states will be returned.

### **Details**

For a given model, each genomic bin can be either called 'unmodified' or 'modified', depending on the posterior probabilities estimated by the Baum-Welch. Thus, a list of models defines a binary combinatorial state for each bin. This binary combinatorial state can be expressed as a decimal number. Example: We have 4 histone modifications, and we run the univariate HMM for each of them. Then we use a false discovery rate of 0.5 to call each bin either 'unmodified' or 'modified'. The resulting binary combinatorial states can then be converted to decimal representation. The following table illustrates this:

bin modification state

decimal state

combinedMultiHMM 21

	model1	model2	model3	model4	
1	0	0	1	0	2
2	0	0	0	0	0
3	0	1	1	0	6
4	0	1	1	1	7

#### Value

Output is a vector of integers representing the combinatorial state of each bin.

binned.data[[basename(file)]] <- binReads(file, binsizes=1000, stepsizes=500,</pre>
                                             assembly=rn4_chrominfo, chromosomes='chr12')
# Obtain the univariate fits
models <- list()</pre>
for (i1 in 1:length(binned.data)) {
models[[i1]] <- callPeaksUnivariate(binned.data[[i1]], max.time=60, eps=1)</pre>
}
## Get the decimal representation of the combinatorial state of this combination of models
states <- chromstaR:::combinatorialStates(models, binary=FALSE)</pre>
## Show number of each state
table(states)
```

combinedMultiHMM

Combined multivariate HMM object

### **Description**

The combined multivariate HMM object is output of the function combineMultivariates and is a list() with various entries. The class() attribute of this list was set to "combinedMultiHMM". For a given hmm, the entries can be accessed with the list operators 'hmm[[]]' or 'hmm\$'.

22 combineMultivariates

#### Value

A list() with the following entries:

info Experiment table for this object.

bins A GRanges-class object containing genomic bin coordinates and human read-

able combinations for the combined multiHMM objects.

segments Same as bins, but consecutive bins with the same state are collapsed into seg-

ments.

segments.per.condition

A list() with segments for each condition separately.

peaks A list() with GRanges-class containing peak coordinates for each ID in

info.

frequencies Genomic frequencies of combinations.

mode Mode of analysis.

### See Also

combineMultivariates, uniHMM, multiHMM

combineMultivariates Combine combinatorial states from several Multivariates

### **Description**

Combine combinatorial states from several multiHMM objects. Combinatorial states can be combined for objects containing multiple marks (mode='combinatorial') or multiple conditions (mode='differential').

# Usage

combineMultivariates(hmms, mode)

### Arguments

hmms A list() with multiHMM objects. Alternatively a character vector with file-

names that contain multiHMM objects.

mode Mode of combination. See Chromstar for a description of the mode parameter.

### Value

A combinedMultiHMM objects with combinatorial states for each condition.

24 conversion

conversion Conversion of decimal and binary states	conversion	Conversion of decimal and binary states	
--	------------	---	--

### **Description**

Convert combinatorial states in decimal representation to combinatorial states in binary representation and vice versa.

# Usage

```
dec2bin(dec, colnames = NULL, ndigits = NULL)
bin2dec(bin)
```

### **Arguments**

dec	A vector with whole numbers.
colnames	The column names for the returned matrix. If specified, ndigits will be the length of colnames.
ndigits	The number of digits that the binary representation should have. If unspecified, the shortest possible representation will be chosen.
bin	A matrix with only 0 and 1 (or TRUE and FALSE) as entries. One combinatorial state per row.

### **Details**

**chromstaR** uses decimal numbers to represent combinatorial states of peaks. These functions serve as a convenient way to get from the efficient decimal representation to a more human-readable binary representation.

# Value

A vector of integers for bin2dec and a matrix of logicals with one state per row for dec2bin.

### **Functions**

- dec2bin: Decimal to binary conversion.
- bin2dec: Binary to decimal conversion.

# Author(s)

Aaron Taudt

```
decimal.states <- c(0:31)
binary.states <- dec2bin(decimal.states, colnames=paste0('mark',1:5))
control.decimal.states <- bin2dec(binary.states)</pre>
```

enrichmentAtAnnotation 25

enrichmentAtAnnotation

Enrichment of (combinatorial) states for genomic annotations

### **Description**

The function calculates the enrichment of a genomic feature with peaks or combinatorial states. Input is a multiHMM object (containing the peak calls and combinatorial states) and a GRanges-class object containing the annotation of interest (e.g. transcription start sites or genes).

### Usage

```
enrichmentAtAnnotation(bins, info, annotation, bp.around.annotation = 10000,
  region = c("start", "inside", "end"), what = "combinations",
  num.intervals = 21, statistic = "fold")
```

### **Arguments**

info The \$bins entry from a multiHMM or combinedMultiHMM object.

The \$info entry from a multiHMM or combinedMultiHMM object.

annotation A GRanges-class object with the annotation of interest.

bp.around.annotation

An integer specifying the number of basepairs up- and downstream of the anno-

tation for which the enrichment will be calculated.

region A combination of c('start', 'inside', 'end') specifying the region of the

annotation for which the enrichment will be calculated. Select 'start' if you

have a point-sized annotation like transcription start sites. Select c('start', 'inside', 'end')

if you have long annotations like genes.

what One of c('combinations', 'peaks', 'counts') specifying on which feature

the statistic is calculated.

num.intervals Number of intervals for enrichment 'inside' of annotation.

statistic The statistic to calculate. Either 'fold' for fold enrichments or 'fraction' for

fraction of bins falling into the annotation.

### Value

A list() containing data.frame()s for enrichment of combinatorial states and binary states at the start, end and inside of the annotation.

### Author(s)

Aaron Taudt

26 enrichment\_analysis

### **Description**

Plotting functions for enrichment analysis of multiHMM or combinedMultiHMM objects with any annotation of interest, specified as a GRanges-class object.

### Usage

```
plotFoldEnrichHeatmap(hmm, annotations, what = "combinations",
   combinations = NULL, marks = NULL, plot = TRUE, logscale = TRUE)

plotEnrichCountHeatmap(hmm, annotation, bp.around.annotation = 10000,
   max.rows = 1000, combinations = NULL,
   colorByCombinations = sortByCombinations,
   sortByCombinations = is.null(sortByColumns), sortByColumns = NULL)

plotEnrichment(hmm, annotation, bp.around.annotation = 10000,
   region = c("start", "inside", "end"), num.intervals = 20,
   what = "combinations", combinations = NULL, marks = NULL,
   statistic = "fold", logscale = TRUE)
```

### **Arguments**

hmm	A combinedMultiHMM or multiHMM object or a file that contains such an object.			
annotations	A list() with GRanges-class objects containing coordinates of multiple annotations The names of the list entries will be used to name the return values.			
what	One of c('combinations', 'peaks', 'counts', 'transitions') specifying on which feature the statistic is calculated.			
combinations	A vector with combinations for which the enrichment will be calculated. If NULL all combinations will be considered.			
marks	A vector with marks for which the enrichment is plotted. If NULL all marks will be considered.			
plot	A logical indicating whether the plot or an array with the fold enrichment values is returned.			
logscale	Set to TRUE to plot fold enrichment on log-scale. Ignored if ${\sf statistic} = {\sf 'fraction'}$ .			
annotation	A GRanges-class object with the annotation of interest.			
bp.around.annotation				
	An integer specifying the number of basepairs up- and downstream of the annotation for which the enrichment will be calculated.			
max.rows	An integer specifying the number of randomly subsampled rows that are plotted from the annotation object. This is necessary to avoid crashing for heatmaps			

colorByCombinations

with too many rows.

 $\label{eq:Alogical} A \ logical \ indicating \ whether \ or \ not \ to \ color \ the \ heatmap \ by \ combinations.$  sortByCombinations

A logical indicating whether or not to sort the heatmap by combinations.

enrichment\_analysis 27

sortByColumns An integer vector specifying the column numbers by which to sort the rows. If

 $\verb|sortByColumns| is specified, will force \verb|sortByCombinations=FALSE|.$ 

region A combination of c('start', 'inside', 'end') specifying the region of the

annotation for which the enrichment will be calculated. Select 'start' if you

have a point-sized annotation like transcription start sites. Select c('start', 'inside', 'end')

if you have long annotations like genes.

num.intervals Number of intervals for enrichment 'inside' of annotation.

statistic The statistic to calculate. Either 'fold' for fold enrichments or 'fraction' for

fraction of bins falling into the annotation.

#### Value

A ggplot object containing the plot or a list() with ggplot objects if several plots are returned. For plotFoldEnrichHeatmap a named array with fold enrichments if plot=FALSE.

#### **Functions**

- plotFoldEnrichHeatmap: Compute the fold enrichment of combinatorial states for multiple annotations
- plotEnrichCountHeatmap: Plot read counts around annotation as heatmap.
- plotEnrichment: Plot fold enrichment of combinatorial states around and inside of annotation.

experiment.table

Experiment data table

### **Description**

A data.frame specifying the structure of the experiment.

# Format

A data frame with columns 'file', 'mark', 'condition', 'replicate', 'pairedEndReads' and 'controlFiles'. Avoid the use of special characters like '-' or '+' as this will confuse the internal file management.

```
data(experiment_table)
print(experiment_table)
```

exportFiles 29

exportFiles Export genome browser uploadable files	
--	--

# Description

These functions allow to export chromstaR-objects as files which can be uploaded to a genome browser. Peak calls are exported in BED format (.bed.gz), read counts in wiggle format (.wig.gz) as RPKM values, and combinatorial states are exported in BED format (.bed.gz).

# Usage

```
exportPeaks(model, filename, header = TRUE, separate.files = TRUE,
    trackname = NULL)

exportCounts(model, filename, header = TRUE, separate.files = TRUE,
    trackname = NULL)

exportCombinations(model, filename, header = TRUE, separate.files = TRUE,
    trackname = NULL, exclude.states = "[]", include.states = NULL)
```

# Arguments

model	A chromstaR-objects.
filename	The name of the file that will be written. The appropriate ending will be appended, either "_peaks.bed.gz" for peak-calls or "_counts.wig.gz" for read counts or "_combinations.bed.gz" for combinatorial states. Any existing file will be overwritten.
header	A logical indicating whether the output file will have a heading track line (TRUE) or not (FALSE).
separate.files	A logical indicating whether or not to produce separate files for each track.
trackname	Name that will be used in the "track name" field of the BED file.
exclude.states	A character vector with combinatorial states that will be excluded from export.
include.states	A character vector with combinatorial states that will be exported. If specified, exclude.states is ignored.

# Value

NULL

### **Functions**

- exportPeaks: Export peak calls in BED format.
- exportCounts: Export read counts as RPKM values in wiggle format.
- exportCombinations: Export combinatorial states in BED format.

### **Examples**

exportGRangesAsBedFile

Export genome browser viewable files

### **Description**

Export GRanges as genome browser viewable file

### Usage

```
exportGRangesAsBedFile(gr, trackname, filename, namecol = "combination",
  scorecol = "score", colorcol = NULL, colors = NULL, header = TRUE,
  append = FALSE)
```

# **Arguments**

gr	A GRanges-class object.
trackname	The name that will be used as track name and description in the header.
filename	The name of the file that will be written. The ending ".bed.gz". Any existing file will be overwritten.
namecol	A character specifying the column that is used as name-column.
scorecol	A character specifying the column that is used as score-column. The score should contain integers in the interval [0,1000] for compatibility with the UCSC genome browser convention.
colorcol	A character specifying the column that is used for coloring the track. There will be one color for each unique element in colorcol.
colors	A character vector with the colors that are used for the unique elements in colorcol.
header	A logical indicating whether the output file will have a heading track line (TRUE) or not (FALSE).
append	Whether or not to append to an existing file.

# **Details**

Export regions from GRanges-class as a file which can be uploaded into a genome browser. Regions are exported in BED format (.bed.gz).

fixedWidthBins

Make fixed-width bins

#### **Description**

Make fixed-width bins based on given bin size.

#### Usage

```
fixedWidthBins(bamfile = NULL, assembly = NULL, chrom.lengths = NULL,
    chromosome.format, binsizes = 1e+06, chromosomes = NULL)
```

#### **Arguments**

bamfile A BAM file from which the header is read to determine the chromosome lengths.

If a bamfile is specified, option assembly is ignored.

assembly An assembly from which the chromosome lengths are determined. Please see

fetchExtendedChromInfoFromUCSC for available assemblies. This option is

ignored if bamfile is specified. Alternatively a data.frame generated by fetchExtendedChromInfoF

chrom. lengths A named character vector with chromosome lengths. Names correspond to chro-

mosomes.

chromosome.format

A character specifying the format of the chromosomes if assembly is specified. Either 'NCBI' for (1,2,3 ...) or 'UCSC' for (chr1,chr2,chr3 ...). If a bamfile or

chrom. lengths is supplied, the format will be chosen automatically.

binsizes A vector of bin sizes in base pairs.

chromosomes A subset of chromosomes for which the bins are generated.

32 genomicFrequencies

#### Value

A list() of GRanges-class objects with fixed-width bins.

### Author(s)

Aaron Taudt

### **Examples**

```
## Make fixed-width bins of size 500kb and 1Mb
data(rn4_chrominfo)
chrom.lengths <- rn4_chrominfo$length
names(chrom.lengths) <- rn4_chrominfo$chromosome
bins <- fixedWidthBins(chrom.lengths=chrom.lengths, binsizes=c(5e5,1e6))
bins

## Make bins using NCBI server (requires internet connection)
# bins <- fixedWidthBins(assembly='mm10', chromosome.format='NCBI', binsizes=c(5e5,1e6))</pre>
```

genes\_rn4

Gene coordinates for rn4

# Description

A data frame containing gene coordinates and biotypes of the rn4 assembly.

#### **Format**

A data.frame.

### **Examples**

```
data(genes_rn4)
head(genes_rn4)
```

genomicFrequencies

Frequencies of combinatorial states

# Description

Get the genomewide frequency of each combinatorial state.

# Usage

```
genomicFrequencies(multi.hmm, combinations = NULL, per.mark = FALSE)
```

getCombinations 33

### **Arguments**

multi.hmm A multiHMM or combinedMultiHMM object or a file that contains such an object.

combinations A vector with combinations for which the frequency will be calculated. If NULL all combinations will be considered.

per.mark Set to TRUE if you want frequencies per mark instead of per combination.

### Value

A table with frequencies of each combinatorial state.

### Author(s)

Aaron Taudt

### **Examples**

getCombinations

Get combinations

### **Description**

Get a DataFrame with combinations from a GRanges-class object.

### Usage

```
getCombinations(gr)
```

### **Arguments**

gr

A GRanges-class object from which the meta-data columns containing combinations will be extracted.

### Value

A DataFrame.

34 getDistinctColors

```
seg.combs <- getCombinations(model$segments)
print(seg.combs)</pre>
```

getDistinctColors

Get distinct colors

### **Description**

Get a set of distinct colors selected from colors.

### Usage

```
getDistinctColors(n, start.color = "blue4", exclude.colors = c("white",
   "black", "gray", "grey", "\<yellow\\>", "yellow1", "lemonchiffon"),
   exclude.brightness.above = 1, exclude.rgb.above = 210)
```

### **Arguments**

n

Number of colors to select. If n is a character vector, length(n) will be taken as the number of colors and the colors will be named by n.

start.color

Color to start the selection process from.

exclude.colors Character vector with colors that should not be used.

exclude.brightness.above

Exclude colors where the 'brightness' value in HSV space is above. This is useful to obtain a matt palette.

exclude.rgb.above

Exclude colors where all RGB values are above. This is useful to exclude whitish colors.

### **Details**

The function computes the euclidian distance between all colors and iteratively selects those that have the furthest closes distance to the set of already selected colors.

# Value

A character vector with colors.

### Author(s)

Aaron Taudt

```
cols <- getDistinctColors(5)
pie(rep(1,5), labels=cols, col=cols)</pre>
```

getStateColors 35

getStateColors

Get state colors

### **Description**

Get the colors that are used for plotting.

### Usage

```
getStateColors(labels = NULL)
```

### **Arguments**

labels

Any combination of c("zero-inflation", "unmodified", "modified", "total", "counts").

### Value

A character vector with colors.

#### See Also

```
plotting
```

# **Examples**

```
cols <- getStateColors()
pie(1:length(cols), col=cols, labels=names(cols))</pre>
```

heatmapCombinations

Plot a heatmap of combinatorial states

### **Description**

Plot a heatmap that shows the binary presence/absence of marks for the different combinations.

# Usage

```
heatmapCombinations(model = NULL, marks = NULL, emissionProbs = NULL)
```

# Arguments

model A multiHMM object or file that contains such an object.

marks A character vector with histone marks. If specified, model will be ignored.

emissionProbs A matrix with emission probabilities where dimnames(emissionProbs) gives

the state labels and marks. This option is helpful to plot probabilistic chromatin states (not part of **chromstaR**). If specified, model and marks will be ignored.

# Value

A ggplot object.

### Author(s)

Aaron Taudt

#### See Also

```
plotting
```

# **Examples**

heatmapCountCorrelation

Read count correlation heatmap

### **Description**

Heatmap of read count correlations (see cor).

### Usage

```
heatmapCountCorrelation(model, cluster = TRUE)
```

# Arguments

model A multiHMM or combinedMultiHMM object or file that contains such an object.

cluster Logical indicating whether or not to cluster the heatmap.

### Value

A ggplot object.

# See Also

```
plotting
```

heatmapTransitionProbs

Heatmap of transition probabilities

# Description

Plot a heatmap of transition probabilities for a multiHMM model.

# Usage

```
heatmapTransitionProbs(model = NULL, reorder.states = TRUE,
    transitionProbs = NULL)
```

#### **Arguments**

model A multiHMM object or file that contains such an object. reorder.states Whether or not to reorder the states. transitionProbs

A matrix with transition probabilities where dimnames(emissionProbs) gives the state labels. This option is helpful to plot transition probabilities directly without needing a chromstaR-objects. If specified, model will be ignored.

#### Value

A ggplot object.

#### See Also

plotting

# **Examples**

loadHmmsFromFiles

Load chromstaR objects from file

# **Description**

Wrapper to load **chromstaR** objects from file and check the class of the loaded objects.

#### Usage

38 mergeChroms

## **Arguments**

files A list of chromstaR-objects or a vector of files that contain such objects.

check.class Any combination of c('GRanges', 'uniHMM', 'multiHMM', 'combinedMultiHMM').

If any of the loaded objects does not belong to the specified class, an error is

thrown.

#### Value

A list of chromstaR-object.

# **Examples**

mergeChroms

Merge several multiHMMs into one object

# **Description**

Merge several multiHMMs into one object. This can be done to merge fits for separate chromosomes into one object for easier handling. Merging will only be done if all models have the same IDs.

# Usage

```
mergeChroms(multi.hmm.list, filename = NULL)
```

# Arguments

multi.hmm.list A list of multiHMM objects or a character vector of files that contain such objects.

filename The file name where the merged object will be stored. If filename is not specified, a multiHMM is returned.

#### Value

A multiHMM object or NULL, depending on option filename.

#### Author(s)

Aaron Taudt

model.combined 39

model.combined

Combined multivariate HMM for demonstration purposes

## **Description**

A combinedMultiHMM object for demonstration purposes in examples of package chromstaR.

#### **Format**

A combinedMultiHMM object.

# **Examples**

model.multivariate

Multivariate HMM for demonstration purposes

# **Description**

A multiHMM object for demonstration purposes in examples of package chromstaR.

#### **Format**

A multiHMM object.

# **Examples**

model.univariate

Univariate HMM for demonstration purposes

# Description

A uniHMM object for demonstration purposes in examples of package chromstaR.

## **Format**

A uniHMM object.

```
## Get an example uniHMM
file <- system.file("data","H3K27me3-BN-rep1.RData", package="chromstaR")
model <- get(load(file))</pre>
```

40 multiHMM

multiHMM Multivariate HMM object

#### **Description**

The multivariate HMM object is output of the function callPeaksMultivariate and is a list() with various entries. The class() attribute of this list was set to "multiHMM". For a given hmm, the entries can be accessed with the list operators 'hmm[[]]' or 'hmm\$'.

#### Value

A list() with the following entries:

info Experiment table for this object.

bincounts A GRanges-class object containing the genomic bin coordinates and original

binned read count values for different offsets.

bins A GRanges-class object containing the genomic bin coordinates, their read

count, (optional) posteriors and state classification.

segments Same as bins, but consecutive bins with the same state are collapsed into seg-

ments.

peaks A list() with GRanges-class containing peak coordinates for each ID in

info.

mapping A named vector giving the mapping from decimal combinatorial states to human

readable combinations.

weights Weight for each component. Same as apply(hmm\$posteriors,2,mean).

weights.univariate

Weights of the univariate HMMs.

transitionProbs

Matrix of transition probabilities from each state (row) into each state (column).

transitionProbs.initial

Initial transitionProbs at the beginning of the Baum-Welch.

startProbs Probabilities for the first bin. Same as hmm\$posteriors[1,].

startProbs.initial

Initial startProbs at the beginning of the Baum-Welch.

convergenceInfo

Contains information about the convergence of the Baum-Welch algorithm.

convergenceInfo\$eps

Convergence threshold for the Baum-Welch.

convergenceInfo\$loglik

Final loglikelihood after the last iteration.

convergenceInfo\$loglik.delta

Change in loglikelihood after the last iteration (should be smaller than eps)

 ${\tt convergenceInfo\$num.iterations}$ 

Number of iterations that the Baum-Welch needed to converge to the desired

eps.

convergenceInfo\$time.sec

Time in seconds that the Baum-Welch needed to converge to the desired eps.

correlation.matrix

Correlation matrix of transformed reads.

#### See Also

```
callPeaksMultivariate, uniHMM, combinedMultiHMM
```

## **Examples**

 ${\tt multivariateSegmentation}$ 

Multivariate segmentation

# Description

Make segmentation from bins for a multiHMM object.

# Usage

```
multivariateSegmentation(bins, column2collapseBy = "state")
```

# Arguments

```
bins A GRanges-class with binned read counts. column2collapseBy
```

The number of the column which will be used to collapse all other inputs. If a set of consecutive bins has the same value in this column, they will be aggregated into one bin with adjusted genomic coordinates.

# Value

A GRanges-class with segmented regions.

plotExpression

Overlap with expression data

# Description

Get the expression values that overlap with each combinatorial state.

# Usage

```
plotExpression(hmm, expression, combinations = NULL, return.marks = FALSE)
```

42 plotExpression

#### **Arguments**

hmm A multiHMM or combinedMultiHMM object or file that contains such an object.

A GRanges-class object with metadata column 'expression', containing the expression value for each range.

Combinations A vector with combinations for which the expression overlap will be calculated. If NULL all combinations will be considered.

Set to TRUE if expression values for marks instead of combinations should be returned.

Totam

#### Value

A ggplot2 object if a multiHMM was given or a named list with ggplot2 objects if a combinedMultiHMM was given.

#### Author(s)

Aaron Taudt

#### See Also

plotGenomeBrowser 45

#### **Description**

Plot a simple genome browser view of chromstaR-objects. This is useful for scripted genome browser snapshots.

#### Usage

```
plotGenomeBrowser(model, chr, start, end, style = "peaks", peakHeight = 0.2,
    peakColor = "blue", same.yaxis = TRUE)
```

# Arguments

model A uniHMM, multiHMM or combinedMultiHMM object or file that contains such an

object.

chr, start, end Chromosome, start and end coordinates for the plot.

style One of c('peaks', 'density').

peakHeight Height of the peak track relative to the count track.

peakColor Color for the peak track.

same.yaxis Whether or not the plots for the same mark have the same y-axis.

#### Value

```
A list() of ggplot objects.
```

```
## Get an example uniHMM ##
file <- system.file("data","H3K27me3-BN-rep1.RData", package="chromstaR")</pre>

46 plotHistogram

plotHistogram

Histogram of binned read counts with fitted mixture distribution

# **Description**

Plot a histogram of binned read counts with fitted mixture distributions from a uniHMM object.

# Usage

```
plotHistogram(model, state = NULL, chromosomes = NULL, start = NULL,
  end = NULL, linewidth = 1)
```

# **Arguments**

model A uniHMM object or file that contains such an object.

state Plot the histogram only for the specified state. One of c('unmodified', 'modified').

chromosomes, start, end

Plot the histogram only for the specified chromosomes, start and end position.

linewidth Width of the distribution lines.

#### Value

A ggplot object.

# See Also

plotting

plotHistograms 47

plotHistograms

Histograms of binned read counts with fitted mixture distribution

#### **Description**

Plot histograms of binned read counts with fitted mixture distributions from a multiHMM object.

#### Usage

```
plotHistograms(model, ...)
```

# **Arguments**

model A multiHMM object or file that contains such an object.

... Additional arguments (see plotHistogram).

#### Value

A ggplot object.

plotting

plotting

chromstaR plotting functions

#### **Description**

This page provides an overview of all **chromstaR** plotting functions.

# **Details**

Plotting functions that work on uniHMM objects:

plotHistogram Read count histogram with fitted mixture distributions.

Plotting functions that work on multiHMM objects:

heatmapCountCorrelation Heatmap of read count correlations.

heatmapTransitionProbs Heatmap of transition probabilities of the Hidden Markov Model.

heatmapCombinations Binary presence/absence pattern of combinatorial states.

plotExpression Boxplot of expression values that overlap combinatorial states.

Plotting functions that work on multiHMM and combinedMultiHMM objects:

heatmapCountCorrelation Heatmap of read count correlations.

plotEnrichCountHeatmap Heatmap of read counts around annotation.

plotEnrichment Enrichment of combinatorial states around annotation.

48 print.multiHMM

```
plotFoldEnrichHeatmap Enrichment of combinatorial states at multiple annotations. plotExpression Boxplot of expression values that overlap combinatorial states.
```

Other plotting functions:

heatmapCombinations Binary presence/absence pattern of combinatorial states.

```
print.combinedMultiHMM
```

Print combinedMultiHMM object

# **Description**

Print combinedMultiHMM object

# Usage

```
## S3 method for class 'combinedMultiHMM' print(x, ...)
```

# **Arguments**

x An combinedMultiHMM object.

... Ignored.

# Value

An invisible NULL.

print.multiHMM

Print multiHMM object

# **Description**

Print multiHMM object

## Usage

```
## S3 method for class 'multiHMM' print(x, ...)
```

# Arguments

x An multiHMM object.
... Ignored.

# Value

An invisible NULL.

print.uniHMM 49

print.uniHMM

Print uniHMM object

#### **Description**

Print uniHMM object

# Usage

```
## S3 method for class 'uniHMM'
print(x, ...)
```

#### **Arguments**

x An uniHMM object.
... Ignored.

#### Value

An invisible NULL.

## **Description**

Import aligned reads from a BAM file into a GRanges-class object.

# Usage

```
readBamFileAsGRanges(bamfile, bamindex = bamfile, chromosomes = NULL,
  pairedEndReads = FALSE, remove.duplicate.reads = FALSE, min.mapq = 10,
  max.fragment.width = 1000, blacklist = NULL, what = "mapq")
```

# **Arguments**

bamfile A sorted BAM file.

bamindex BAM index file. Can be specified without the .bai ending. If the index file does

not exist it will be created and a warning is issued.

chromosomes If only a subset of the chromosomes should be imported, specify them here.

pairedEndReads Set to TRUE if you have paired-end reads in your BAM files (not implemented

for BED files).

remove.duplicate.reads

A logical indicating whether or not duplicate reads should be removed.

min.mapq Minimum mapping quality when importing from BAM files. Set min.mapq=0

to keep all reads.

max.fragment.width

Maximum allowed fragment length. This is to filter out erroneously wrong frag-

ments due to mapping errors of paired end reads.

blacklist A GRanges-class or a bed(.gz) file with blacklisted regions. Reads falling into

those regions will be discarded.

what A character vector of fields that are returned. Uses the Rsamtools::scanBamWhat

function. See Rsamtools::ScanBamParam to see what is available.

#### Value

A GRanges-class object containing the reads.

#### **Examples**

#### **Description**

Import aligned reads from a BED file into a GRanges-class object.

# Usage

```
readBedFileAsGRanges(bedfile, assembly, chromosomes = NULL,
  remove.duplicate.reads = FALSE, min.mapq = 10,
  max.fragment.width = 1000, blacklist = NULL)
```

# **Arguments**

bedfile A file with aligned reads in BED-6 format. The columns have to be c('chromosome', 'start', 'end', 'desc

 ${\tt assembly} \qquad \qquad {\tt Please \ see \ fetch Extended Chrom Info From UCSC \ for \ available \ assemblies. \ Only}$ 

necessary when importing BED files. BAM files are handled automatically.

Alternatively a data.frame with columns 'chromosome' and 'length'.

chromosomes If only a subset of the chromosomes should be imported, specify them here.

remove.duplicate.reads

A logical indicating whether or not duplicate reads should be removed.

min.mapq Minimum mapping quality when importing from BAM files. Set min.mapq=0

to keep all reads.

max.fragment.width

Maximum allowed fragment length. This is to filter out erroneously wrong frag-

ments.

blacklist A GRanges-class or a bed(.gz) file with blacklisted regions. Reads falling into

those regions will be discarded.

readConfig 51

#### Value

A GRanges-class object containing the reads.

#### **Examples**

readConfig

Read chromstaR configuration file

## **Description**

Read a chromstaR configuration file into a list structure. The configuration file has to be specified in INI format. R expressions can be used and will be evaluated.

#### Usage

```
readConfig(configfile)
```

#### **Arguments**

configfile Path to the configuration file

# Value

A list with one entry for each element in configfile.

#### Author(s)

Aaron Taudt

readCustomBedFile

Read bed-file into GRanges

# Description

This is a simple convenience function to read a bed(.gz)-file into a GRanges-class object. The bed-file is expected to have the following fields: chromosome, start, end, name, score, strand.

# Usage

```
readCustomBedFile(bedfile, col.names = c("chromosome", "start", "end", "name",
   "score", "strand"), col.classes = NULL, skip = 0,
   chromosome.format = "NCBI", sep = "")
```

52 removeCondition

## **Arguments**

bedfile Filename of the bed or bed.gz file.

col.names A character vector giving the names of the columns in the bedfile. Must con-

tain at least c('chromosome', 'start', 'end').

col.classes A character vector giving the classes of the columns in bedfile. Speeds up the

import.

skip Number of lines to skip at the beginning.

chromosome.format

Desired format of the chromosomes. Either 'NCBI' for (1,2,3 ...) or 'UCSC'

for (chr1,chr2,chr3 ...) or NULL to keep the original names.

sep Field separator from read. table.

#### Value

A GRanges-class object with the contents of the bed-file.

#### Author(s)

Aaron Taudt

# **Examples**

removeCondition

Remove condition from model

# Description

Remove a condition from a combinedMultiHMM object.

# Usage

```
removeCondition(model, conditions)
```

## **Arguments**

model A combinedMultiHMM object or file which contains such an object.

conditions A character vector with the condition(s) to be removed.

# Value

The input combinedMultiHMM object with specified conditions removed.

scanBinsizes 53

#### **Examples**

scanBinsizes

Find the best bin size for a given dataset

# **Description**

Use simulations to find the best bin size among a set of input files. There is no guarantee that the bin size will be the best for your data, since it is only "best" in terms of fewest miscalls for simulated data. However, it can give you a hint what bin size to choose.

# Usage

```
scanBinsizes(files.binned, outputfolder, chromosomes = "chr10", eps = 0.01,
  max.iter = 100, max.time = 300, repetitions = 3,
  plot.progress = FALSE)
```

# **Arguments**

files.binned	A vector with files that contain binned.data in different bin sizes.
outputfolder	Name of the folder where all files will be written to.
chromosomes	A vector of chromosomes to use for the simulation.
eps	Convergence threshold for the Baum-Welch algorithm.
max.iter	The maximum number of iterations for the Baum-Welch algorithm. The default -1 is no limit.
max.time	The maximum running time in seconds for the Baum-Welch algorithm. If this time is reached, the Baum-Welch will terminate after the current iteration finishes. The default -1 is no limit.
repetitions	Number of repetitions for each simulation.
plot.progress	If TRUE, the plot will be updated each time a simulation has finished. If FALSE, the plot will be returned only at the end.

#### **Details**

The function first runs callPeaksUnivariate on the given binned.data files. From the estimated parameters it generates simulated data and calls the peaks on this simulated data. Because the data is simulated, the fraction of miscalls can be precisely calculated.

54 scores

#### Value

A ggplot object with a bar plot of the number of miscalls dependent on the bin size.

# Author(s)

Aaron Taudt

scores

chromstaR scores

# **Description**

Various scores used in chromstaR.

# Usage

```
differentialScoreMax(mat, info, FUN = "-")
differentialScoreSum(mat, info, FUN = "-")
```

# **Arguments**

mat A matrix with posterior probabilities, read counts or any other matrix with these

dimensions. Column names must correspond to the ID entries in info.

info An experiment. table with additional column 'ID'.

FUN A function to compute the score with.

# Value

A numeric vector.

#### **Functions**

- differentialScoreMax: Maximum differential score. Values are between 0 and 1. A value of 1 means that at least one mark is maximally different between conditions.
- differentialScoreSum: Additive differential score. Values are between 0 and N, where N is the number of marks. A value around 1 means that approximately 1 mark is different, a value of 2 means that 2 marks are different etc.

# Author(s)

Aaron Taudt

simulateMultivariate 55

simulateMultivariate Simulate multivariate data

# **Description**

Simulate known states, read counts and read coordinates using a multivariate Hidden Markov Model.

#### Usage

```
simulateMultivariate(bins, transition, emissions, weights, correlationMatrices,
  combstates, IDs, fragLen = 50)
```

# **Arguments**

bins A GRanges-class object for which reads will be simulated.

transition A matrix with transition probabilities.

emissions A list() with data frames with emission distributions (see uniHMM entry 'distri-

butions').

weights A list() with weights for the three univariate states.

correlationMatrices

A list with correlation matrices.

combstates A vector with combinatorial states.

IDs A character vector with IDs.

fragLen Length of the simulated read fragments.

#### Value

A list() with entries \$bins containing the simulated states and read count, \$reads with simulated read coordinates.

 $\verb|simulateReadsFromCounts||$ 

Simulate read coordinates

#### **Description**

Simulate read coordinates using read counts as input.

# Usage

```
simulateReadsFromCounts(bins, fragLen = 50)
```

#### **Arguments**

bins A GRanges-class with read counts.
fragLen Length of the simulated read fragments.

# Value

A GRanges-class with read coordinates.

56 state.brewer

simulateUnivariate Simulate univariate data

#### **Description**

Simulate known states, read counts and read coordinates using a univariate Hidden Markov Model with three states ("zero-inflation", "unmodified" and "modified").

# Usage

```
simulateUnivariate(bins, transition, emission, fragLen = 50)
```

## **Arguments**

bins A GRanges-class object for which reads will be simulated.

transition A matrix with transition probabilities.

emission A data.frame with emission distributions (see uniHMM entry 'distributions').

fragLen Length of the simulated read fragments.

#### Value

A list with entries \$bins containing the simulated states and read count, \$reads with simulated read coordinates and \$transition and \$emission.

state.brewer Obtain combinatorial states from specification

# **Description**

This function returns all combinatorial (decimal) states that are consistent with a given abstract specification.

#### Usage

```
state.brewer(replicates = NULL, differential.states = FALSE, min.diff = 1,
  common.states = FALSE, conditions = NULL, tracks2compare = NULL,
  sep = "+", statespec = NULL, diffstatespec = NULL,
  exclusive.table = NULL, binary.matrix = NULL)
```

#### **Arguments**

replicates A vector specifying the replicate structure. Similar entries will be treated as

replicates.

differential.states

A logical specifying whether differential states shall be returned.

min.diff The minimum number of differences between conditions.

common.states A logical specifying whether common states shall be returned.

state.brewer 57

conditions

A vector with the same length as replicates. Similar entries will be treated as belonging to the same condition. Usually your tissue or cell types or time points.

tracks2compare A vector with the same length as replicates. This vector defines the tracks between which conditions are compared. Usually your histone marks.

sep

Separator used to separate the tracknames in the combinations. The default '+' should not be changed because it is assumed in follow-up functions.

statespec

If this parameter is specified, replicates will be ignored. A vector composed of any combination of the following entries: '0.[]', '1.[]', 'x.[]', 'r.[]', where [] can be any string.

- '0.A': sample A is 'unmodified'
- '1.B': sample B is 'modified'
- 'x.C': sample C can be both 'unmodified' or 'modified'
- 'r.D': all samples in group D have to be in the same state
- 'r.[]': all samples in group [] have to be in the same state

diffstatespec

A vector composed of any combination of the following entries: 'x.[]', 'd.[]', where [] can be any string.

- 'x.A': sample A can be both 'unmodified' or 'modified'
- 'd.B': at least one sample in group B has to be different from the other samples in group A
- 'd[]': at least one sample in group [] has to be different from the other samples in group []

exclusive.table

A data. frame or tab-separated text file with columns 'mark' and 'group'. Histone marks with the same group will be treated as mutually exclusive.

binary.matrix

A logical matrix produced by dec2bin. If this is specified, only states specified by the rows of this matrix will be considered. The number of columns must match length(replicates) or length(statespec). Only for advanced use. No error handling for incorrect input.

# **Details**

The binary modification state (unmodified=0 or modified=1) of multiple ChIP-seq samples defines a (decimal) combinatorial state such as:

	sample1	sample2	sample3	sample4	sample5	combinatorial state
bin1	0	0	1	0	0	4
bin2	0	0	0	0	0	0
bin3	0	1	0	1	0	10
bin4	0	1	1	1	1	15
bin5	0	0	1	0	1	5

#### Value

A data frame with combinations and their corresponding (decimal) combinatorial states.

#### Author(s)

Aaron Taudt, David Widmann

58 stateBrewer

#### **Examples**

```
# Get all combinatorial states where sample1=0, sample2=1, sample3=(0 or 1),
# sample4=sample5
chromstaR:::state.brewer(statespec=c('0.A','1.B','x.C','r.D','r.D'))
# Get all combinatorial states where sample1=sample2=sample3, sample4=sample5
chromstaR:::state.brewer(statespec=c('r.A','r.A','r.A','r.B','r.B'))
# Get all combinatorial states where sample1=sample5, sample2=sample3=1,
# sample4=(0 or 1)
chromstaR:::state.brewer(statespec=c('r.A','1.B','1.C','x.D','r.A'))
```

stateBrewer

Obtain combinatorial states from experiment table

# **Description**

This function computes combinatorial states from an experiment.table.

#### Usage

```
stateBrewer(experiment.table, mode, differential.states = FALSE,
  common.states = FALSE, exclusive.table = NULL, binary.matrix = NULL)
```

#### **Arguments**

experiment.table

A data.frame specifying the experiment structure. See experiment.table.

mode

Mode of brewing. See Chromstar for a description of the parameter.

differential.states

A logical specifying whether differential states shall be returned.

common.states

A logical specifying whether common states shall be returned.

exclusive.table

A data. frame or tab-separated text file with columns 'mark' and 'group'. Histone marks with the same group will be treated as mutually exclusive.

binary.matrix

A logical matrix produced by dec2bin. If this is specified, only states specified by the rows of this matrix will be considered. The number of columns must match length(replicates) or length(statespec). Only for advanced use. No error handling for incorrect input.

#### **Details**

The binary modification state (unmodified=0 or modified=1) of multiple ChIP-seq samples defines a (decimal) combinatorial state such as:

	sample 1	sample2	sample3	sample4	sample5	combinatorial state
bin1	0	0	1	0	0	4
bin2	0	0	0	0	0	0
bin3	0	1	0	1	0	10
bin4	0	1	1	1	1	15
bin5	0	0	1	0	1	5

subsample 59

#### Value

A data frame with combinations and their corresponding (decimal) combinatorial states.

#### Author(s)

Aaron Taudt

# **Examples**

subsample

Normalize read counts

# Description

Normalize read counts to a given read depth. Reads counts are randomly removed from the input to match the specified read depth.

# Usage

```
subsample(binned.data, sample.reads)
```

# **Arguments**

binned.data A GRanges-class object with meta data column 'reads' that contains the read

count.

sample.reads The number of reads that will be retained.

# Value

A GRanges-class object with downsampled read counts.

# Author(s)

Aaron Taudt

60 transitionFrequencies

transitionFrequencies Transition frequencies of combinatorial states

# **Description**

Get a table of transition frequencies between combinatorial states of different multiHMMs.

# Usage

```
transitionFrequencies(multi.hmms = NULL, combined.hmm = NULL,
zero.states = "[]", combstates = NULL)
```

# **Arguments**

multi.hmms A named list with multiHMM objects or a vector with filenames that contain such

objects.

combined.hmm A combinedMultiHMM object. If specified, multi.hmms is ignored.

zero.states The string(s) which identifies the zero.states.

combstates Alternative input instead of multi.hmms: A named list of combinatorial state

vectors instead of HMMs. Names must be of the form "combination.X", where  $\boldsymbol{X}$  is an arbitrary string. If this is specified, multi.hmms and combined.hmm will

be ignored.

# Value

A data frame with transition frequencies.

#### Author(s)

Aaron Taudt

uniHMM 61

uniHMM	Univariate HMM object

# **Description**

The univariate HMM object is output of the function callPeaksUnivariate and is a list() with various entries. The class() attribute of this list was set to "uniHMM". For a given hmm, the entries can be accessed with the list operators 'hmm[[]]' or 'hmm\$'.

#### Value

A list() with the following entries:

info Experiment table for this object.

bincounts A GRanges-class object containing the genomic bin coordinates and original

binned read count values for different offsets.

bins A GRanges-class object containing the genomic bin coordinates, their read

count, (optional) posteriors and state classification.

peaks A list() with GRanges-class containing peak coordinates for each ID in

info.

weights Weight for each component. Same as apply(hmm\$posteriors,2,mean).

transitionProbs

Matrix of transition probabilities from each state (row) into each state (column).

transitionProbs.initial

Initial transitionProbs at the beginning of the Baum-Welch.

startProbs Probabilities for the first bin. Same as hmm\$posteriors[1,].

startProbs.initial

Initial startProbs at the beginning of the Baum-Welch.

distributions Estimated parameters of the emission distributions.

distributions.initial

Distribution parameters at the beginning of the Baum-Welch.

post.cutoff Cutoff for posterior probabilities to call peaks.

convergenceInfo

Contains information about the convergence of the Baum-Welch algorithm.

convergenceInfo\$eps

Convergence threshold for the Baum-Welch.

 ${\tt convergenceInfo\$loglik}$ 

Final loglikelihood after the last iteration.

convergenceInfo\$loglik.delta

Change in loglikelihood after the last iteration (should be smaller than eps)

convergenceInfo\$num.iterations

Number of iterations that the Baum-Welch needed to converge to the desired eps.

convergenceInfo\$time.sec

Time in seconds that the Baum-Welch needed to converge to the desired eps.

convergenceInfo\$max.mean

Value of parameter max. mean.

convergenceInfo\$read.cutoff

Cutoff value for read counts.

62 unis2pseudomulti

#### See Also

callPeaksUnivariate, multiHMM, combinedMultiHMM

unis2pseudomulti

Combine univariate HMMs to a multivariate HMM

# **Description**

Combine multiple uniHMMs to a multiHMM without running callPeaksMultivariate. This should only be done for comparison purposes.

# Usage

```
unis2pseudomulti(hmms)
```

# **Arguments**

hmms

A named list of uniHMM objects. Names will be used to generate the combinations.

#### **Details**

Use this function if you want to combine ChIP-seq samples without actually running a multivariate Hidden Markov Model. The resulting object will be of class multiHMM but will not be truly multivariate.

# Value

A multiHMM object.

#### Author(s)

Aaron Taudt

```
# Get example BAM files for 2 different marks in hypertensive rat (SHR)
file.path <- system.file("extdata","euratrans", package='chromstaRData')</pre>
files <- list.files(file.path, full.names=TRUE, pattern='SHR.*bam$')[c(1,4)]
# Bin the data
data(rn4_chrominfo)
binned.data <- list()</pre>
for (file in files) {
binned.data[[basename(file)]] <- binReads(file, binsizes=1000, stepsizes=500,</pre>
                                             assembly=rn4_chrominfo, chromosomes='chr12')
}
# Obtain the univariate fits
models <- list()</pre>
for (i1 in 1:length(binned.data)) {
models[[i1]] <- callPeaksUnivariate(binned.data[[i1]], max.time=60, eps=1)</pre>
## Combine the univariate HMMs without fitting a multivariate HMM
names(models) <- c('H3K27me3','H3K4me3')</pre>
```

variableWidthBins 63

variableWidthBins

Make variable-width bins

#### **Description**

Make variable-width bins based on a reference BAM file. This can be a simulated file (produced by TODO: insert link and aligned with your favourite aligner) or a real reference.

#### Usage

```
variableWidthBins(reads, binsizes, chromosomes = NULL)
```

#### **Arguments**

reads A GRanges-class with reads. See readBamFileAsGRanges and readBedFileAsGRanges.

binsizes A vector with binsizes. Resulting bins will be close to the specified binsizes.

chromosomes A subset of chromosomes for which the bins are generated.

#### **Details**

Variable-width bins are produced by first binning the reference BAM file with fixed-width bins and selecting the desired number of reads per bin as the (non-zero) maximum of the histogram. A new set of bins is then generated such that every bin contains the desired number of reads.

## Value

A list() of GRanges-class objects with variable-width bins.

#### Author(s)

Aaron Taudt

64 zinbinom

```
## Plot the distribution of binsizes
hist(width(bins[['1000']]), breaks=50)
```

writeConfig

Write chromstaR configuration file

# **Description**

Write a chromstaR configuration file from a list structure.

# Usage

```
writeConfig(conf, configfile)
```

# Arguments

conf

A list structure with parameter values. Each entry will be written in one line.

configfile

Filename of the outputfile.

#### Value

NULL

# Author(s)

Aaron Taudt

zinbinom

The Zero-inflated Negative Binomial Distribution

# Description

Density, distribution function, quantile function and random generation for the zero-inflated negative binomial distribution with parameters w, size and prob.

# Usage

```
dzinbinom(x, w, size, prob, mu)
pzinbinom(q, w, size, prob, mu, lower.tail = TRUE)
qzinbinom(p, w, size, prob, mu, lower.tail = TRUE)
rzinbinom(n, w, size, prob, mu)
```

zinbinom 65

#### **Arguments**

Χ	Vector of (non-negative integer) quantiles.
W	Weight of the zero-inflation. $\emptyset \le w \le 1$ .
size	Target for number of successful trials, or dispersion parameter (the shape parameter of the gamma mixing distribution). Must be strictly positive, need not be integer.
prob	Probability of success in each trial. 0 < prob <= 1.
mu	Alternative parametrization via mean: see 'Details'.
q	Vector of quantiles.
lower.tail	logical; if TRUE (default), probabilities are $P[X \le x]$ , otherwise, $P[X > x]$ .
p	Vector of probabilities.
n	number of observations. If $length(n) > 1$ , the length is taken to be the number required.

#### **Details**

The zero-inflated negative binomial distribution with size = n and prob = p has density

$$p(x) = w + (1 - w) \frac{\Gamma(x+n)}{\Gamma(n)x!} p^n (1-p)^x$$

for  $x = 0, n > 0, 0 and <math>0 \le w \le 1$ .

$$p(x) = (1 - w) \frac{\Gamma(x+n)}{\Gamma(n)x!} p^n (1-p)^x$$

for 
$$x = 1, 2, ..., n > 0$$
,  $0 and  $0 \le w \le 1$ .$ 

# Value

dzinbinom gives the density, pzinbinom gives the distribution function, qzinbinom gives the quantile function, and rzinbinom generates random deviates.

#### **Functions**

• dzinbinom: gives the density

• pzinbinom: gives the cumulative distribution function

• qzinbinom: gives the quantile function

• rzinbinom: random number generation

#### Author(s)

Matthias Heinig, Aaron Taudt

#### See Also

Distributions for standard distributions, including dbinom for the binomial, dnbinom for the negative binomial, dpois for the Poisson and dgeom for the geometric distribution, which is a special case of the negative binomial.
